Cauliflower, per bbl, $1 00@$5 00; Squash, Marrow, $0 75@$1 00; do Hubbard, $1 00@$1 25, Celery, per doz. bunches, 15c@$1 00.

WOOL—Spring Texas, 17@23c, and Fall do 20@25c; Fall California, 15@18c, and Spring do 19@25; Scoured Texas 52@53c, Delaine, 36c, Indiana, 33c; Scoured Territory, 55c; Donskoi, 44½c; XX Ohio, 54c, Scoured Colorado, 53c; Australian, 38c.

GRAIN MARKETS.

WHEAT—Sales—No. 1 Hard at 95c delivered; No. 1 Northern, 9[illegible]92c, delivered; Ungraded Winter Red; 7[illegible]85c; No. 2 Red in elevator quoted, 81½@81½c. No. 3 Red quoted 81½@82c, elevator. RYE.—Held higher, but prices are more or less nominal. Western quoted, 5[illegible]56. BARLEY.—Unchanged in price and dull. CORN. Continued small receipts and scarcity of stock, together with the advance in wheat, had a stimulating effect on the general market. Sales—Ungraded Mixed and White at 40½@43¼c; No. 2 43⅝@43⅝c, elevator, 42¾@43c afloat; No 2 White quoted at 41½@44c, elevator; No. 1 November, 43⅜@43¾c. OATS.—No. 3 Mixed at 27c; No. 3 White 29½@29½c; No. 2 Mixed, 2[illegible]@2[illegible]c elevator, 28½c delivered; No. 2 White, 30¼@30½c; No. 1 White, 34½c; Mixed Western, 25½@29c; White do, 30@36c.

LIVE STOCK MARKETS.

BEEVES.—Very common to prime bullocks sold at $3 25@$4 75c per 100 lbs; oxen and stags at $2 75@$3 70; cows at $1 85@$2 87½c, and bulls at $2 00@$2 75. Latest private cable advices from Great Britain indicate a continued dull market for beef and cattle, and prices are weak all around.

MILCH COWS.—Receipts for the week thus far 126 head. Good stock scarce and a little firm but common cows are plenty and not wanted. Inferior stock sells at $25@$35, decent to good at $35@$50 per head.

CALVES.—Grassers at $2@$2 40; Fed Calves and Mixed at $3@$4 50; Veals at $5@$8, and Western Calves at $3 10@$3 87½.

SHEEP AND LAMBS.—"Culls" Sheep sold at $2 50@$3; ordinary to good at $3 00@$3 25; common to very choice Lambs at $5 35@$6 65, and a load of extra heavy do at $6 70; "Culls" sold at $4 50, and mixed stock at $4 30@$5

HOGS.—No sales on live weight. Nominally weak at $4@$4 40 per 100 lbs.

MASON & HAMLIN
The Cabinet Organ was introduced in its present form by Mason & Hamlin in 1861. Other makers followed in the manufacture of these instruments, but the Mason & Hamlin Organs have always maintained their supremacy as the best in the world.
Mason & Hamlin offer, as demonstration of the unequalled excellence of their organs, the fact that at all of the great World's Exhibitions, since and including that of Paris, 1867, in competition with best makers, of all countries, they have invariably taken the highest honors. Illustrated **ORGANS** catalogues free. **$22 to $900**
Mason & Hamlin do not hesitate to make the extraordinary claim for their Pianos, that they are superior to all others. They recognize the high excellence achieved by other leading makers in the art of piano building, but still claim superiority. This they attribute solely to the remarkable improvement introduced by them in the year 1882, and now known as the "MASON & HAMLIN PIANO STRINGER," by the use of which is secured the greatest possible purity and refinement of tone, together with greatly increased capacity **PIANOS** GRAND & UPRIGHT, for standing in tune and other important advantages.
A circular, containing testimonials from three hundred purchasers, musicians, and tuners, sent, together with descriptive catalogue, to any applicant.
Pianos and Organs sold for cash or easy payments; also rented.

Law.

"Every Man is presumed to know the Law. Nine-tenths of all Litigation arises from Ignorance of Law."

DESCENT OF PROPERTY IN ARKANSAS.

L. A. M., Lawrence County, Ark.—A died intestate lately in this neighborhood, leaving a large farm and considerable wild land in another part of the State. He also left a mother and sister and also three children of a half-sister. Can the half-sister's children inherit any of the property?

ANS.—By the law of descent and distribution in Arkansas, relatives of the half blood inherit equally with those of the whole blood in the same degree. To this rule there is one exception: if the property in question came to the deceased by gift, descent or devise, then those persons not of the blood of the ancestor from whom it came are excluded from the succession. In the case put by our correspondent, we are not told whether A was male or female. We assume that the intestate died without leaving wife or husband, descendants or father. That being the case, if the estate in question came to the deceased from his or her father, it will revert to the father's heirs: if it came from the mother, it will revert to her and her heirs: but if the estate is a new acquisition, it will go to the mother during her life-time and then descend to the collateral kindred. On the completion of the mother's life estate, the children of the half-sister will together be entitled to a share equal to that of the sister of the deceased.

LONG LEASES IN OHIO.

L. M., Morgan County, Ohio.—A leased a farm to B for 10 years; and after the lapse of one year and seven months sold the property to C who wants to obtain possession on or before next New Year's Day. Can he do so to A's loss?

ANS.—In Ohio all leases for a longer term than three years must be in writing and signed by the parties concerned, in the presence of two witnesses, who shall subscribe their names as witnesses, and such signatures shall be acknowledged before some officer having authority to acknowledge deeds, and the acknowledgment thereof shall be in all respects the same as the acknowledgment of deeds. The lease must be recorded in the office of the Recorder of the county in which the premises are situated, and unless so recorded or filed for record, the same shall be deemed fraudulent so far as relates to a bona-fide purchaser of the property, having, at the time of the purchase, no knowledge of the existence of such an instrument. If A went through the above formalities with his lease of the property, he can hold it against C by performing the terms of the lease; if he failed to do so, C can legally obtain possession of the farm, if he did not know of the lease when he bought it.

A WIDOW'S RIGHT OF "QUARANTINE" IN NEW YORK STATE.

"An Old Subscriber," Oneida County, N. Y.—A man dies at home on his farm in this State without leaving a will. His mother and several brothers and sisters are therefore interested in his estate as well as his wife. Does the latter as a tenant in common have a right to live on the homestead without paying rent, and, if so, has she a right to the whole house or only rights with the others? At the time of the man's death and since, none of his relatives have lived in the house, except the widow, and he left no children.

ANS.—By the statutes of this State the widow has the right to "tarry in the chief house of her husband" 40 days after his death without being liable for any rent, and in the meantime is entitled to her sustenance out of the estate. At the expiration of the 40 days she may be expelled by the heirs if she cannot make an agreement to rent the premises. If the whole house was necessary for her accommodation, she could retain possession of it all during the "quarantine," and this is usually allowed.

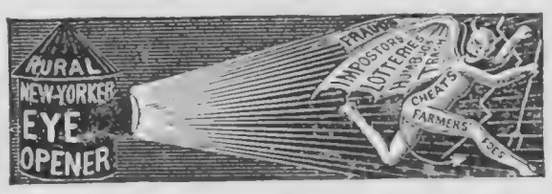
RECOVERY OF STOLEN PROPERTY.

L. N. T., Williamsport, Pa.—Several months ago a valuable horse was stolen from A, a neighbor of mine. The other day he discovered him in the possession of B living nearly 100 miles away. B is known as an honest man, and declares he bought the horse of C, who also has a fair reputation. C says he bought him from a traveling dealer who had several other horses for sale. Can A recover the horse from B without tracing him through the various hands through which he may have passed?

ANS.—Yes; if he can prove the identity of the animal. A stolen or mortgaged horse may pass through the hands of 50 men, each of them acting in good faith and paying full value for him, without in the least impairing the right of the owner or mortgagee to take the animal whenever and wherever he can find him. Under such circumstances the purchaser has no better title than the thief had.

A. P., Norden, Neb.—G put two mares to a stallion. He was not to pay for the services of the stallion unless they proved to be with foal. Before this could be proved G's barn was burnt and with it both mares. Must G pay for the services of the stallion?

ANS.—Under the rather peculiar circumstances we should say decidedly not. Of course, it is not to be presumed for a moment that the burning of the barn and its valuable contents was due to any fault on his part. As the owner of the stallion cannot prove that the services his horse was guaranteed to perform, had actually been performed, he has no legal means of forcing payment therefor.



A PRECIOUS TRIO OF SWINDLERS.—The Cromo Printing and Publishing Company of Cincinnati, Ohio, was one of the humbugs, or rather swindles, most strongly denounced by the Eye-Opener half a dozen years ago. Back of it were a trio of rascals who, after a long career of successful fraud, have been checked by the strong arm of the law, at least temporarily. Their real names or aliases are Algernon Granville, Frank Gerrish and E. Harmon Clark. All three were arrested the other day, at Chicago, by the Post-office authorities for sending fraudulent matter through the United States mails. The Eye-Opener's knowledge of the fellows began away back when under the guise of the Cromo Printing and Publishing Company, they published a catchpenny affair called The People's Safeguard. This was promptly denounced in this department. It offered prizes amounting to $15,000 to the persons who would first guess the number of links in a watch chain a cut of which was given in the paper. Each guesser was required to forward a small sum of money with his estimate of the number of links. This neat little scheme netted the rascals $8,000 to $10,000, before the Post-office authorities discovered its nature, and arrested Granville, who posed as the editor of the Safeguard. Over 300,000 letters received by the concern from its dupes in all parts of the country were captured, many bitterly complaining of the frauds practiced by it on the public. Though hundreds of persons guessed the correct number, not a single prize was ever paid. Swindling of this sort is, of course, an almost invariable characteristic of the concerns who make offers of that sort. Granville was soon released under $1,500 bail, and has never been tried. For the next few years the rascals practiced different kinds of confidence games in various parts of the country, and, finally, about two years ago, settled down in Chicago where they organized the Imperial Printing and Publishing Company. Soon afterwards this was stigmatized as a fraud by the Eye-Opener. The firm from the outset worked the "green goods" game on a new plan.

They decided to dispense with the publication of a paper and depend entirely on weekly publications with a big circulation. It is deplorable that many of these, whether exclusively weekly prints or weekly editions of dailies, are ready to admit into their columns all sorts of advertisements, however doubtful or fraudulent they may be on their face, provided payment to themselves is assured. What could bear on its face more plainly its fraudulent character than the following advertisement which this bogus concern found no difficulty in getting inserted in scores of papers all over the country.

WANTED—A slick man in every county to handle our excellent goods; one that is willing to take risks for large gains; goods done up in packages of 1s. 5s, and 10s. Address, by express only at our expense, Imperial Engraving Company, 280 South Clark Street, Chicago, Ill.

Of course many inquiries were received in answer to such advertisements from all parts of the country. In reply the rascals sent carefully worded notes telling of the nature of the "goods" or "engravings" in which they were dealing and giving the prices. As a sample of the engraving a $1 bank note was inclosed in each letter. As fast as the remittances poured in, the orders for the "engravings" were filled by forwarding needles done up in "packages of ones, fives and tens." Of course the dupes were in no position to cause a scandal, being self-implicated swindlers. Numerous swindles of the above kinds are still flourishing rankly in various parts of the country, and this exposure of those that have "come to grief" should serve as a warning against others of the same stripe which have as yet escaped the clutches of the law.

LIVE STOCK INSURANCE RISKS.—The recent failure of the Standard Mutual Live Stock Insurance Company of Reading, Pa., against which the Eye-Opener warned readers of the R. N.-Y. over a year ago, well illustrates a form of fraud to which farmers are frequently exposed under the most plausible appearances. The company had issued over 8,000 policies on horses alone, and a large amount of money is still due to owners whose animals have died. Although started in Reading, the concern's principal business offices were in Philadelphia and the heaviest proportion of the fraudulent losses were incurred there and in the neighboring districts. There is little doubt that at the outset it was intended to do an honest business, but when temptation to fraud came at a period of financial stringency, the moral forces of the managers were not strong enough to resist. Horses that were almost worthless were insured by the agents for large amounts, and in nearly every instance the horses died in a suspiciously short time after they had been insured.

It is now charged by the company that the insurance paid on such animals was invariably divided by the policy-holders with the agents who made the insurance. Of course in such frauds the honest policy-holders who were assessed for the payment of the fraudulent policies suffered heavily. Culpable carelessness on the part of the managers and flagrant fraud on the part of the agents naturally rendered the company slow in meeting the claims of its policy-holders, and some of those whose claims had been long outstanding brought suits against the company for the amount of their policies. With the ventilation of its methods of conducting the business came the collapse of the company, and the honest policy-holders who had for a long time been paying assessments to meet fraudulent and other losses, in addition to heavy expenses incurred by the officers, were left in the lurch. Several other similar companies in Pennsylvania are said to be in as bad a plight as the Standard was before its real condition was ventilated in court.

The most vexatious and dangerous feature of this and of all similar mutual assessment benefit or insurance associations in all parts of the country, is that every member is considered, in law, as part of the partnership. The opinion widely prevails among the members of such societies that if any of them does not desire to pay his assessment he need not do so, and that that will be the end of his membership in the society. Practically that is the way in which such schemes are worked, as the officers seldom force the members to pay their dues; but should any of the societies ever get into financial trouble the members would find that its creditors could sue all and every one of the policy-holders for assessments enough to pay their claims. All participate in the profits and are held liable for a share of the debts, if any exist. Resignations from the association would not avail, and persons who supposed that their membership had lapsed from non-payment of assessments, would realize, on the subpœna of a constable, that they were still active members, liable for their share of the just debts of the society.

Literary.

BOOK REVIEWS.

READY FOR BUSINESS or Choosing an Occupation, is the title of a small book by George J. Manson, which is intended, as its name indicates, for a guide or help to young men in the selection of their life-work. It points out the requirements and possibilities of various occupations, mechanical, mercantile and professional, and indicates the steps necessary to enter any apprenticeship. The occupation that engages the attention of more men than any other in this country, the one which is the foundation of all others, is—perhaps inadvertently—omitted. The book is very evidently written by a New Yorker, and it is possible that he never heard of the science and profession of Agriculture. There never was a time when specialists were in such demand, and received such returns for their skill as the present. The man who can do one thing extremely well is the successful man, and it behooves every young man to learn his capabilities, and choose well the occupation for which he is best adapted. Cloth; five by 6½ inches; 108 pages; 75 cents; Fowler & Wells Company, New York.

EVERY-DAY BIOGRAPHY is, as its name indicates, a volume intended for every-day reading. Several very brief sketches of prominent Americans, as well as of some English and European celebrities are given for each day; the arrangement being made according to the birthdays of the subjects noticed *e. g.*, October 30; in addition to several others, "Andrew Jackson Downing, an American landscape gardener and author, born in Newburg, N. Y., October 30, 1815. He was lost on the Henry Clay, a North River steamboat, July 28, 1852. He was editor of the Horticulturist for six years previous to his death: and his 'Fruits and Fruit-Trees of America,' has passed through several editions. He probably had few superiors as a landscape gardener, even in Europe." The list of subjects includes all classes of society, but the majority, we are glad to note, are Americans. An alphabetical index is given of all persons noticed, so that one may readily refer to any desired name. It is a most excellent book for a busy man or woman. Cloth: five by 7½ inches; 378 pages; $1.50; Fowler & Wells Co., New York.

PENS AND TYPES is a small volume by Benjamin Drew which is intended, so the author says, as hints and helps for those who write, print, read, teach or learn and this should include nearly every body. It treats of writing for the press, proof-reading, style, punctuation, orthography, capitalization, etc. There is a great deal of valuable information for all students. In writing of typographical errors the author expresses the opinion that many, if not most, of them are due to illegible penmanship, and we are inclined to think from our own experience that he is more than half right. This book, thoroughly read, would tend to do away with much of this, and might avert the strained relations that sometimes exist between editors and contributors. It is a helpful book. Cloth; five by 6½ inches; 204 pages, revised edition; $1.25. Lee and Shepard, Boston.

OSBORNE OF ARROCHAR by Amanda M. Douglas, is a good example of fiction for its own sweet sake. There is no lurking "purpose" to disturb the even flow of events; there is not even a villain; the beauties are extremely beautiful; the lovers are models, and there are enough to go around. The moral tone is good, and if numerous tricks of manner and circumstance seem oddly familiar to readers of Miss Douglas's earlier works, still the book is very pleasant reading. Cloth; six by eight inches; 449 pages; $1.50. Lee and Shepard, Boston.

CHRYSANTHEMUM SHOW AT THE UNITED STATES NURSERIES, SHORT HILLS, N. J.

(RURAL SPECIAL REPORT.)

A fine show; its arrangements; some choice orchids; fancy prices; bewildering chrysanthemums; Mrs. Alpheus Hardy; the Snowball; Shasta; blooms of great size; Lacroix, and other fine varieties; red sorts make a poor show; duration of the exhibition extended.

IF all the members of the R. N.-Y. family could have seen the orchid and chrysanthemum show given by the United States Nurseries, Short Hills, N. J., November 4th to 9th, instead of having but a bald report, with all the brightness and beauty left out, they might have considered themselves most fortunate.

The exhibition was arranged in four long, continuous greenhouses with the climax at the farther end. As the visitor entered the orchids first claimed attention. The houses were filled down the center with ferns, palms, anthuriums, and the like, bordered with Zebra-striped Marantas and fine grasses, and banked at the ends with masses of blooming orchids. Around the sides were cypripediums, or lady's slippers, of which the firm catalogue about 400 varieties. Only a few sorts of these showed bloom, though some of the few were quite rare.

Among the more showy orchids were some fine plants of Phalænopsis, with large narcissus-like clustered blooms. The pale-yellow clusters of Oncidium varicosum recalled the touch-me-not of our swamps; while O. ornithorhynchum showed large clusters of fine, pinkish-mauve flowers, not at all showy, but of such rare fragrance that the single plant filled the house with its delightful odor. More conspicuous than any of these, though less beautiful, was a large plant of Vanda Sanderiana, claimed to be the finest now in the States, and valued at $1,000. But most charming of all were some sister plants, Vanda cœrulea, with large bouquets of delicately-veined or spotted blooms, of pale lavender-blue with darker centers.

At the foot of the stairs leading to the chrysanthemum-house, a dazzling scene met the eye. The entire center of the long house was filled with an oblong bed of the famous $1,500 chrysanthemum, Mrs. Alpheus Hardy, which was one sheet of feathery, frost-like bloom. To see this was alone worth the trip. The entire circumference outside the walk was banked with plants of great variety and innumerable colors. Most of them were grown in the beds, but all spaces were filled with plants in pots, to make a complete mass of color. Prominent on one side toward the center was the Snowball, a perfect white variety of first size, with broad, twisted petals. Across from it was Shasta, a very free-blooming white Japanese, with drooping tubular petals and of immense size.

The variety that could show a measurement of less than four inches was "nowhere," and, indeed, very few such were seen. In the first tour around the house, about 20 prominent varieties were noted, none less than six or seven inches across, as large as paeonies, but delicately shaded in color, and perfect in make-up. Ordinary blooms of Mrs. A. Hardy were from four to five inches across, and last year this was about the limit; but now a few strong plants that had been grown for exhibition blooms showed flowers that must have measured over seven inches! Perhaps the largest of all was Philippe Lacroix, having a thick bloom of pale pink, with twisted, drooping petals; two other fine pinks were Excellent, a huge Chinese incurved, of a pale lilac rose shade, and Lillian B. Bird, an exquisite creamy shell-pink Japanese sort of immense size.

Three fine yellows of first size were M. Constant Varin, and La Fortune, golden yellow, and Mrs. H. Cannell, primrose-yellow, "one of the best." California is still paler, a beautiful shade, but the blossom is not quite so full. A huge, fluffy, blush-white, very beautiful, first sent out by the proprietors, is known as Sunny-side. A creamy-white, Tacoma, is called the best for general planting because of being very profuse and a rank grower; it is not quite so large and perfect as some sorts.

But these huge show varieties have little use for florists' work, or for personal wear. Three fine, white sorts for this purpose are Alaska, Narragansett and Belle Pointevine. Jeanne d'Arc is a perfect white, having the outer tips just touched with pink. A second, and a third trip around failed to show a single red variety worthy to rank for beauty with those already mentioned. Many were large and of fine shape, but the colors are all shades of magenta or of brick-red, and are very ugly. Mrs. Andrew Carnegie, from which so much was hoped, proved disappointing, the petals curving to show only the dull side. The nearest approach to a pretty red sort was Bras Rouge, which has its petals rolled into tubes which show the dark-red prettier side.

The courtesy of the firm in providing refreshments and carriages for its guests is worthy of note, and was well appreciated. It was decided to hold the exhibition open for another week. C. S. VALENTINE.

CATALOGUES, ETC., RECEIVED.

"DISHORNING." This is the title of Bulletin No. 10 from the Mississippi Experiment Station. The first sentence in the book is as follows:

"For this spelling the reader is respectfully referred to all the dictionaries and encyclopedias."

The R. N.-Y. would like to inform "the reader" before he starts out that this examination of "all the dictionaries and encyclopedias" will result in a wild-goose chase. Analogy with regard to the formation of other words with the same prefix, however, would lead us to prefer dehorning to dishorning. Thus Webster gives the obsolete word dehusk. Dr. Phares, the author of this bulletin, has prepared the most concise and practical treatise on the subject that we have yet seen. "Mr. Haaff, the original dehorner," seems to know all about the subject, but his teaching is conducted in such a hammer-and-tongs style that he fails to convince many people who ought to be convinced. Dr. Phares is a man of long experience in the treatment of cattle diseases as well as in the management of stock for the dairy or shambles. The following extracts give an idea of the plan of the bulletin:

"The operation, may be performed on animals of any age with little danger of serious injury. So far as pain and danger are concerned, the section may be made at any distance from the skin. But other considerations determine the place of section. As a rule, the nearer the head the better. Notwithstanding the assertions of many that the operation never injures the animal and never endangers life, we have too much testimony from the best surgeons and have had too many calls for assistance to accept the statement.

In some instances the hemmorrhage has been very large, extremely prostrating and requiring most active and skillful treatment to arrest it and save life. Fever has followed loss of appetite and flesh, with slow recovery. It is true such cases are rare, yet as they do occur, every care and precaution should be observed to give the animal the best chances. We are convinced that we have seen instances in which, if death has not been absolutely caused, it has at least been hastened by the operation. Without great loss of blood, there have been many cases in which there have been some fever, nervousness, diminished appetite, flesh and milk. It is not a very rare thing for some suppuration to occur after operation; and more rarely caries of the bone gives trouble for months, with offensive discharges. Hemmorrhage is from one artery—rarely two—situated at that part of the stub near the ear. Hence it will be perceived that plugging the sinus through which one sees some inches down into the head is worse than useless for stopping the flow of blood. But solution of persulphate of iron (Monsel's solution) thrown into the artery or introduced with a glass point instantly forms with the blood a firm clot or plug. The flow may sometimes be arrested by compress and bandage around the head above the ears.

When a large horn is removed a frightful, large raw surface is left, and in its middle a huge cavern extends down into the head. One may see into this cavern several inches; the polished white walls reflecting the light well illuminate its interior. Some operators have mistaken this white surface for brain, and declare that they cut off the horns down to the brain; others within an inch of the brain, exposing that important organ to view. This, if true, would be horrible, and render the operation many thousand fold more dangerous and cruel.

A moment's glance at the anatomy of the head will show the absurdity of such assertions, and that a belt three inches broad, including the entire top of the head may be removed without touching the brain. Equally absurd is the twaddle about the cruelty of cutting through the exquisitely sensitive marrow of the horn core. Nothing could be more useless or out of place than marrow in the ox horn. The formation of the core has been explained. Now a word about its covering—the horn proper. This is of about the same character, chemically, as hair, hoof or nails. It is secreted or formed in about the same manner. In the horn of the calf, when but two or three inches long, elongated bundles resembling masses of agglutinated hairs are as readily perceived as the bundles of fibers in boiled lean beef. A number of organs are wisely formed with little or no sensitiveness, as liver, lungs, heart, brain, because in these sensitiveness would be much worse than merely useless,—absolutely pernicious. So the horn possesses no great degree of sensitiveness, being intended for great exposures, for hard usage and violent blows. There is no need, then, no place for the morbid, mawkish sentimentalism so much affected by writers and talkers on the subject of dishorning.

Horns are often lost by various accidents. Not long ago, in the herd of the writer, a beautiful cow made a vicious charge with all her power upon another, who received the shock in such a way as to suffer no injury, while at the moment of collision a horn of the assailant was snatched off instantly, leaving the entire core uncovered. In a few weeks it was recovered with a layer of horn, but deformed. The next day another cow lost a horn in the same way. In some instances both horn and core are knocked off; and cases have been seen in which both horn and core were broken some inches from the head and required surgical aid.

In many instances horns are ornamental, and in some countries, in a state of nature, useful to protect against the attacks of beasts of prey. But in domestication, protected from these dangers, the horns are well-nigh or wholly useless to the animal. In a herd as a whole they are injurious, being employed to injure each other. They are often injurious to the individual. Finding that he has weapons with which he can assail others he neglects his legitimate business of grazing, browsing, taking water, and wastes time in teasing others and keeping them away from food and drink. He is all the time more or less excited and uncomfortable, so that his own well-being is impaired by having horns. Deprived of them he becomes quiet, not liable to violent excitement, eats, drinks, sleeps, enjoys contentment and grows fat. So much from his own standpoint.

From the proprietor's standpoint: The horns of the stronger are a terror to the weaker animals, which are deterred from food, drink, rest; persecuted, gored, bruised, excited in a tyrannical, cruel manner, appealing powerfully to the pity of the merciful owner for relief. "For the righteous man regardeth the life of his beast." These considerations justify the removal of all horns.

But man is financially interested in the matter. Since dishorning is really a merciful procedure, he should have no scruples about resorting to it to protect his property and promote his interest. He prevents these animals from wounding and bruising and famishing one another, saves a vast amount of time in handling, of room in sheltering, and of feed stuff. His beeves are fatted for market with much less expense of feed and in less time. They go into the markets, as attested by the dealers at the great cattle depots, in much better condition, having whole hides and unbruised flesh, both of which sell more promptly and at better prices, while the cost of transportation of the live animals is much less, because a large number can be packed in each car. For like reasons the milk, cream and butter products are increased in quantity and improved in quality. It is true that the product is in some instances slightly reduced for a few days after being dishorned, but after the excitement passes off and the wounds heal the beneficial results are permanent.

The operation should be performed when the animal is in good, sound condition and plenty of good, wholesome food and water and good quarters accessible. The healing should generally be complete in from three to eight weeks according to size of the wounds. Usually no application to the raw surface is necessary except pine tar."

PREVENTING THE INJURIES OF POTATO ROT.—This is the most interesting topic discussed by Prof. Weed in Bulletin No. 6, volume 2 of the Ohio Experiment Station. Some weeks ago the R. N.-Y. referred to the results claimed by Prof. Weed. These results are now repeated for the purpose of emphasizing them. All through the East rot and "blight" have done a great amount of damage this season and potato growers are anxiously looking for some way of fighting these diseases. Here are the conclusions reached by Prof. Weed:

"So far as a single experiment can be relied upon, the results here reported seem to me to indicate the correctness of the following provisional conclusions:

(1.) That a large proportion of the injury done by the potato rot can be prevented by spraying the vines with the Bordeaux Mixture.

(2.) That this treatment apparently diminishes the amount of scab affecting the tubers.

(3.) That by adding London-purple to the mixture the same treatment may be made effective in preventing the injuries both of rot and Colorado Potato Beetle."

Although the R. N.-Y. has repeatedly given the formula for the "Bordeaux Mixture," we quote what Prof. Weed has to say about it

"The solution used was what is commonly known as the "Bordeaux Mixture," the standard formula for which is as follows:

"Dissolve six pounds of sulphate of copper in 16 gallons of water, in another vessel slake four pounds fresh lime in six gallons of water. When the lime mixture has cooled to the temperature of the air, pour slowly into the copper solution, mixing the fluids thoroughly by constant stirring."

As this formula seemed to be rather expensive on account of the large amount of copper sulphate required, I diluted it about one-half, using six pounds copper sulphate and four pounds lime to 50 gallons water instead of 22 gallons, as ordinarily recommended. We usually made it by filling our Nixon barrel machine, which holds 50 gallons, nearly full of water, and then adding three or four gallons hot water in which the six pounds of copper sulphate crystals had been dissolved. The freshly slaked lime was then poured in, and after a thorough stirring the mixture was ready for use. Sometimes instead of the crystals we used *powdered* copper sulphate, in which case it was not necessary to heat water to dissolve it, the powder being simply put in the barrel of clear water and was soon dissolved. When we wished to add London-purple, we simply put it in either before or after the mixture was made."

Those of our readers who are of an investigating turn of mind are respectfully requested to add this experiment to their list for next year.

Horticultural.

A FARMER'S SMALL FRUIT GARDEN.

T. B. TERRY.

Worth reading, studying and imitating: the small-fruit plot; treatment and kinds planted; cultivation at odd times; pleasure in work; a non-regrettable mistake; small fruits galore in 15 months from planting; truth frozen in a photo; "seeing is believing;" great pleasure and profit within reach of all for small outlay.

THREE years ago the writer knew but little about the small-fruit business. He certainly did not know in how short a time after the plants were set out one could get a good crop of raspberries. Probably many readers of the R. N.-Y. are equally ignorant. With the hope of starting some farmers to growing small fruits in abundance for home use, he gives his experience, with a photograph from life to back it. There are 100 rods of pretty good garden soil between my house and the little orchard seen in the background of the picture at Fig. 282. It slopes toward the east, where the house stands. One year ago last April, I determined to devote this land to small fruits for our home use. It was then a very heavy clover sod, which had been mowed one year. It was thoroughly plowed and harrowed, and about the first of May, raspberry, blackberry, currant, grape and strawberry plants were set out. I bought two or three little books treating on the subject, and read up the back numbers of the papers on small-fruit culture. Several friends in the business were consulted as to the choice of varieties. I was practically entirely green in the business, never having set out a raspberry plant or a grape-vine, nor had I seen any one else do it.

I put no manure on the land, as I felt that it could not be spared from the fields. What has been done comes from good tillage on a heavy clover sod. We set out four varieties of red raspberries, three of black-caps, three of blackberries, two of currants and quite a number of grapes. Last summer we kept the cultivator and hoe moving pretty constantly in that patch. We would run through it hastily with the cultivator before going into the potato field, after a shower, and then after we got through in the field we would go over the fruit garden again and finish around the plants with the hoe or rake. The rows were all eight feet apart and there was plenty of room to turn at the ends. It took only an hour or two to go over the plot with the cultivator. We hardly missed the time. We always kept ahead of the weeds, just stirring the mellow ground each time, so that it was a pleasant job. It was a great surprise and pleasure also to see how the plants grew under such treatment. In a very short time passers-by seemed to look as though they were surprised too. This stimulated us to work even more faithfully. I got so interested that before fall I would have laughed at an offer of $100 for my vines and plants, which I presume had not really cost me more than $50, labor and all.

We had rows of strawberries between the rows of raspberries, grapes, etc. This was a mistake; but still we got probably 20 bushels of berries, all of which we ate and canned or gave away. This was not new, as we had had strawberries before. On the Fourth of July we ate our last strawberries for dinner, and that night we had our first raspberries for supper. At this time (August 3) the raspberries are not quite gone. During the past month we have had them not as freely as we had strawberries, but in great abundance. They were large and fine. We cut the bushes about two-thirds back last spring, and took care to keep the ground mellow about them, or mulched during the season. I confess I never knew how nice raspberries might be until I had eaten heaping saucers full of Cuthberts and Shaffers, large and fresh, right from my own bushes and fully ripe when picked.

Now, this might all pass as talk, not exactly lying, but the rather pardonable exaggeration of an enthusiast; but, friends, how about the photograph? It shows our two rows of Shaffer Raspberries only. There was a shrub in the way so we were obliged to set the camera close to the ends of the rows, which brings the first bushes out of focus; but you can see the middle of the rows. They were set eight feet apart, but you can see that there was only room to go between them when the photograph was taken, and they were still growing. As to hight, my man who stands there is five feet 10 inches without his hat. The rows of raspberries are each six rods long and we have certainly picked more than a bushel to the row from the rows you see, while the prospect for next year is tremendous. As soon as the strawberries were all picked we cut up the vines and mulched all the ground between the rows of raspberries heavily, with the strawberry vines and wheat straw. The picture shows this. Cultivation has, of course, not been needed since then.

Now had I written that in 15 months from setting out the plants, I had grown raspberry bushes six feet high and six feet wide, which had during that time produced berries enough to more than pay for the plants and labor, how many farmers without experience would have believed it? But there is the photograph, and you know I would not dare lie about the time of setting the plants out, or much about the yield, with the R. N.-Y. coming to neighbors. Oh! my friends, you can get lots of pleasure, and for months have the choicest berries on the table at every meal as free as water from a very little good land, if you will only be thorough in your work. The cost of the plants and vines is hardly worth mentioning; the knowledge of how to do it is now free to all; all that is lacking is grim determination. How many farmers will get that before next spring?

Summit County, O.

T. B. TERRY'S RASPBERRY PATCH. From a Photograph. Fig. 282.

Dairy Husbandry.

HOW DO YOU PROCEED TO

DRY UP

Your Cows? Methods of Feeding

OR

Treatment. Some Able Dairymen

STATE FACTS!

FROM SMITHS, POWELL & LAMB.

Of course, any one acquainted with dairying matters knows that exceptions are met with at almost every turn, and for these exceptions the treatment must be special. We aim to give all our cows a rest from milking after making a record. This we do both for the good of the animal and the calf it will produce. We prefer to milk young heifers through the entire season, believing that it may influence the milking properties of the calf which any of them carries. We intend to allow our cows to go dry from four weeks to two months, the period depending somewhat upon circumstances and the amount of milk they have been giving the previous season, their condition, etc. We lessen the feed, particularly the grain feed we give them and many

times discontinue it entirely, or feed only the very lightest food, such as wheat-bran. Of course, enough has to be fed an animal to keep her in good condition, and some animals will not very materially diminish the quantity of milk they give unless a decided reduction is made in their feed. The drying off of cows is probably one of the nicest and most careful requirements of the dairy, and our opinion is that more injured udders are produced by improperly drying cows than by any other cause. As soon as the quantity of milk will permit, we stop milking twice a day, and milk only once a day for some time, and then when the condition of the animal and the amount of milk she is giving permit it, we begin to skip a day, then two, and so on, until the cow ceases to give any milk.

There is a very great difference between cows of the same breed as regards their inclination to dry off. However, Holstein-Friesians, as a class, we think are more inclined to milk continuously than any other breed we know of. We can cite many instances in our own herd, where we have found it either very difficult or impossible to dry off cows. Notable instances of this character were the famous cow Clothilde, which gave over 26,000 pounds of milk in a year, and Addie, which gave over 17,000 pounds in a year, and both of them milked for several successive seasons without being dry, although the grain ration was taken away entirely and the fodder ration was reduced to the lowest quantity that we felt the health of the cow and fœtus would admit of. Other instances of this same character could be specified, but space forbids. We regard it as a very dangerous procedure to attempt to dry off a cow, the natural inclination of which is to give milk, even though she gives milk for a longer time than we think best for her own good and that of the calf. We prefer to have a cow milk continuously, season after season, rather than to run the risk of injuring her udder by forcing her to become dry.

Syracuse, N. Y.

FROM GEO. M. ORRIS.

I gradually discontinue the grain feed of the cows we want to dry off, beginning two months before they are due to calve, except a part of the ration of bran. Then I begin by milking them once per day for a time; then I leave longer intervals between milkings. I keep a more careful watch when the milk gets thick in the udder, milking it out as often as necessary, and keep watch of the udder almost till calving time. I try not to have my cows go dry over one month, and a young cow with her first calf I try to milk up to calving time almost. At present, I have two heifers that are due now, and had commenced to spring the udder before I quit milking. Now we only try not to allow any milk to get thick. I think it is better for young cows not to dry them up very long. I try to feed a cow well while she is dry, so that she will gain in condition, but not lay on fat. I do not feed any corn-meal at this time—only wheat bran and clover hay. I do not find quite as much difference between cows of the same breed as between cows of different breeds. My Jerseys milk for a longer period than do my Short-horns, but the feed has a good deal to do with cows keeping up their flow of milk for a long period. Cows dropping calves in the fall, keep up the flow of milk for a longer period than cows which drop their calves in the spring. I am sure that a cow will do better after calving if she has been dry a reasonable length of time. But cows will *not* do better after calving in proportion to the length of time they are dry; for I have seen cows go dry after milking for four or five months, and they would not do as well as cows that were not dry at all.

Meadville, Pa.

FROM L. F. ALLEN.

There are several ways of drying off a cow from her milk, such as milking only once a day; not milking the udder clean; rubbing the bag with salt and water, and some other ways familiar to all cow keepers. A period of four to six weeks is long enough to let a cow go dry. To let her remain so longer than that is to lose time. I have not, as a rule, made changes in the food of the cows while they are going dry. I have found little difference in drying off different breeds of cows. The habit is acquired chiefly from the treatment of the cow when breeding early.

The Guernseys, in my experience, hold out longest in milking. It is impossible to dry off many of them from the time they have one calf until they have another, and still they bring a good calf. The yield of milk will increase for days or weeks until the usual quantity is given. I prefer that a cow should go dry for four to six weeks.

Buffalo, N. Y.

FROM C. M. WINSLOW.

I should like to have my cows go dry about a month or six weeks; but I seldom get them dried off much before they begin to "spring" and sometimes I am not able to dry them entirely then. I milk once a day for a few days; then skip a day; then skip two days, etc., but when I milk, I milk clean. I find some variation among cows of the same breed and even of the same family. A cow will also milk up to calving time some years, while in others she will go dry a longer or shorter time. I think both cow and calf are stronger if the cow goes dry a month or so, and the cow usually has a better udder after she has had a rest. In trying to dry off a cow, I should, of course, take away the extra feed.

Brandon, Vt.

FROM DAVID CARLL.

My cows are Jerseys, all of my own raising, and are inclined to milk until near calving time. I feed a grain ration of wheat-bran and corn-meal to all milch cows the year round. About six week before they are due to calve, I reduce this feed from one-half to two-thirds, milking them only once a day for a few days and then every alternate day for a few days more, when they usually dry up. Occasionally one will milk up to calving. A few years ago I had a Jersey cow that dropped six calves before she was seven years old, and she was never dry after she first came in milk until she died when eight years of age. She produced some valuable calves and gave a good quantity of milk which made as large a quantity of butter as the milk of many cows does in a life-time of as many more years.

In my opinion a cow should go dry six weeks. It is undoubtedly better for the cow and for the calf. There is a difference in cows of the same breed and of the same family. I think a good deal depends upon the management of the cow the first year she is in milk. If she is well fed and properly milked to near calving time, she will be more likely to continue giving milk persistently than if she is carelessly milked and allowed to dry up soon.

Suffolk County, N. Y.

FROM A. L. CROSBY.

When I have occasion to dry off a cow, I milk her but once a day for a few days, then every alternate day for a few days more, and after that watch her udder to see that there is not too much milk in it; if so I milk out a part of it. But my practice now is not to dry the cows off at all, but to milk them up to the time the milk changes, just before calving. The only change I make in the feed is to decrease the grain ration in winter; in summer I stop it altogether, but let the cow have all the hay or grass she wants. My cows are registered and high-grade Jerseys and this breed is one of persistent milkers, the from-calf-to-calf kind. Of course, there is some difference even between cows of the same breed, but I don't believe my Jerseys average much over two weeks "dry;" I don't think I ever had one go dry for four weeks. Some of my cows have never been dry since they dropped their first calves; for instance, my oldest Jersey is now carrying her seventh calf, calving the first time at two years old, and she has never been dry. Her calves make fine cows, two of them being considerably larger than their dam. It is reasonable to suppose that a calf dropped by a cow that gave rich milk nearly up to calving time, will not enter the world in a "fat" condition, but "change of pasture makes fat calves," and if you want a fat calf you can "change its pasture" after its birth, and find cheaper pasturage than the butter fat of the milk. I want no calves fat except the bull calves to be sold for veal. I have not noticed any injury to cow or calf as the result of milking the cow up to time of calving and do not know of any reason why there should be.

Catonsville, Md.

FROM W. B. PRATT.

To dry off a cow, milk but once a day for awhile; then less frequently as the flow is checked, giving the milk to the pigs, and when the secretion is wholly arrested empty the udder thoroughly to avoid danger from garget or other obstructions in the teats when the cow again comes in. Cows should have a rest of at least two months, and if they get more than that, there is no loss of yearly profit and there certainly is a saving of time in drawing grudgingly-yielded strippings. A good cow will store up flesh and energy during her vacation, and run off the same into the milk pail when she resumes business. One that will not do so has mistaken her calling and should be disposed of. No change should be made in the feeding except that special messes, as of meal, should be omitted when early-cut hay and corn-fodder are so good as to cause an increase of weight and improvement in the general condition during the period of idleness. If the cow does not thus improve, cut the fodder earlier next year, feed plentifully, and there will be no failure or unnatural stimulation by a meal diet to the animal's harm. A great difference appears in different breeds and herds and the persistent milking quality appears to so run in families that the character of the calf in this respect when matured can be safely predicted. The man who keeps but a single cow would perhaps be better served by a long milker; but where a number of cows are kept, I am inclined to think that long milkers are not so very much more valuable than the others, as people usually think. I have cows that would give milk up to the time of calving, but I have never allowed them to do so; and therefore I have not had experience on this point. The rule has been to choke them off at a proper time beforehand. I have had cows so liberal and persistent in their milk yields as to become too shadowy to please the eye of the lover of sleek-looking stock. Such a tendency has been checked by extending the intervals between calving to a year and a half. This may be advantageously done when a part of the herd are wanted fresh for winter use.

Prattsburgh, N. Y.

FROM C. M. LUSK.

I milk twice each day till about the first of December and then once each day till the cows are within six or eight weeks of calving; then I stop short and after three or four days, I milk them clean; I do so again about a week later. I have never had any trouble in drying off a cow in this way. I aim to let my cows rest about two months. Some will go longer and some not so long. All the change I make in the feed is to give less grain; or none at all if I have been feeding. I do find a great difference between cows of the same breed as to drying off. I have had cows that could hardly be induced to give milk to within four months of coming in; while others would give milk to the day of calving, both kinds being kept on the same feed. The former are disposed of at the first opportunity. I now have two cows that will give milk to the time of calving and they did it last season although I intended to dry them off two weeks before calving. I do not think the calves were as strong as they would have been had the dams dried off, but the cows did as well as any cows I had. A cow that is disposed to run to milk requires more feed than one that is not in order to keep her up. It is a poor policy to feed all cows the same ration of feed. The more milk a cow gives the more feed she ought to have. I have had cows that I could not get fat while milking and feeding, consequently I had to stop feeding till they were dried off. Other cows would take on fat without materially increasing the flow of milk. The former are the cows for the dairy; the latter for beef, and the sooner they go to the shambles the better.

Broome County, N. Y.

A PAIR OF TAME DEER. FROM A PHOTOGRAPH. FIG. 283.

The Naturalist.

TAME DEER.

SOME weeks ago our friend William Anderson, of Alcona County, Michigan, wrote of a brace of tame deer that had become genuine family pets. At our request he sent a photograph of the deer, a reproduction of which is shown at Figure 283. It is a beautiful little picture—we do not know when we have seen a prettier one. It will make some of our Eastern readers think hard when they consider the surroundings of farmers who can show such pets right out of the neighboring forests. "Farming pays," however, right in the locality where these animals were bred. "Farming pays" anywhere, for that matter, when brains and business are used as a farm team, and the kindness and patience that were needed to turn these naturally wild animals into gentle and loving pets, have done their full share towards making "farming pay" in the highest and noblest sense.

Architecture.

A CHEAP METHOD OF INCREASING BARN OR STABLE ROOM.

AT Fig. 284 we show a cheap method of increasing the scanty barn room of many farms. The addition consists simply of a lean-to added to either end of an ordinary barn; these may be used for stables, for storing implements, wagons, etc., for a shop, or various other purposes. The artist has represented them as having each a small door, but for housing implements larger doors will be necessary. Windows might also be added, and other changes may suggest themselves. The cut is intended simply as a hint of the possibilities of such additions. The capacity of a barn may be nearly doubled, while the expense need not be heavy. Floors may be added or not, according to the uses to which the ad-

dition is to be put. Such additions are preferable to separate small buildings for the reason that they are more sheltered from storms and winds, are more

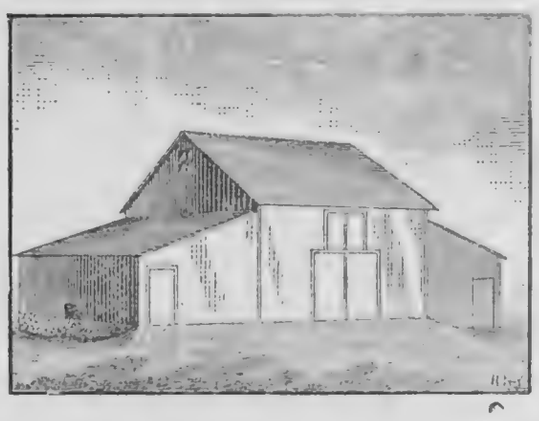

Fig. 284.

convenient in doing chores, and may be utilized for storing grain, hay, etc., in productive seasons.

Sheep Husbandry.

OPHTHALMIA IN SHEEP.

HENRY STEWART.

INFLAMMATION of the eyes with resulting loss of sight is a frequent disease in sheep in the winter. When once it begins in a flock such is its contagious nature that it will quickly spread through the whole unless the right precautions are taken. This disease mostly has its beginning in the fall; when the sheep are pastured upon stubble, the stiff, short straws come in contact with the eyes wounding and irritating them and causing the inflammation, which, unallayed by any curative measures, proceeds to suppuration, and a secretion of diseased pus which is left on the feeding racks or other places and is thus communicated to the other sheep. This pus is also deposited within the space between the cornea and the conjunctiva or covering membrane, which lies over the cornea and, doubling back, covers the under surface of the eyelids, thus completely inclosing the front portion of the eye. Here it forms a bluish-white layer, at first cloudy and partly transparent, but at length becoming thick and opaque and totally obscuring the sight. Or this deposit may be made between the capsule of the crystalline lens and the adjoining membrane in front of it (the membrane of the aqueous humor) and thus form the deeper obstruction commonly known as a "cataract," and very difficult to remove.

The pain from this intense inflammation is very great and seriously disturbs the health of the sheep which stop feeding, grow thin and in time suffer from a complication of disorders to which these animals are so subject, and when the spring arrives and the shepherd hopes his troubles are over, the animals die and both they and their lambs are lost, and the care and feeding through the winter are labor and money thrown away.

The disease in question is one that is to be prevented, if possible, by avoiding the cause. One winter some years ago my flock was diseased in this way, and looking for the cause, I found fragments of rye beard and of chaff from the rye straw used as litter and of which the sheep ate freely at night, lodged in the eyes. Previously I had noticed the sheep troubled by weeping and inflamed eyes when running on the rye stubble in the young clover, and by the immediate removal of these causes and simple treatment the trouble was removed. Afterwards by looking out for any possible cause in this direction, I avoided any more of this disorder. At times the use of Timothy hay will cause the disease and more especially when the racks are made so wide apart that the sheep can thrust their heads through the bars and among the stiff stems and so wound the eyes, and the seeds or chaff can get into them. A good form of rack to avoid this trouble is that here shown at Fig. 285.

The front is made of upright bars two inches wide and three inches apart; the back part is of boards set closely together and sloping forward at the bottom, so that the hay slides down and keeps close to the bars in front where the sheep can reach it. The trough for grain is at the front. The rack is raised a foot from the ground on small posts six or eight feet apart, so that young lambs cannot get fast in any way. Two of these racks may be set together, connected behind so as to form a double rack to be placed in the middle of the shed, and others may be built against the sides of the shed. If the hay-loft is over the sheep-shed the hay may be dropped into the racks with the least possible labor. Since I first used this kind of rack I have never had any trouble with inflamed eyes in my sheep, in the winter.

A frequent cause of this disorder among Western flocks is the alkaline dust of the soil in the dry, hot weather, and the intensely hot reflection of the heat rays of the sun. Where this difficulty is experienced the sheep may be saved by being inclosed during the middle of the day for some hours, and let out to feed in the evening and night when the soil is not so dry or dusty and the heat of the sun has passed. Another very common cause is the use of a too close and warm stable from which the sheep are turned out and exposed to a cold storm of sleet or rain or damp snow; or to dry snow and bright sunshine, the reflection of which is painful to the eyes and produces snow blindness and inflammation. Saturated fleeces chill the sheep and when the chilled animals go into a close stable they huddle together and steam and stew and over-heat themselves, and make the skin so tender that they suffer from the cold on going out again, and thus, passing from one extreme to another, contract an inflammatory condition which may affect the eyes and the nasal membranes, producing catarrh of these organs, or causing disorder of the lungs.

The following treatment will be found effective for the trouble after the causes are removed. First the affected sheep should be removed to a separate place which is dark and protected from the most severe cold. They should be given a light, cooling, antiseptic medicine, hyposulphite of soda in dram doses daily being very useful. The eyes should be examined for any foreign substance, which should be removed if easily possible, by a soft camel's-hair pencil; otherwise a small quantity of linseed mucilage—made by boiling linseed in a little water—may be injected into the eye, by which the offending matter will be able to make its way to the outer corner of the eye where it can be seen and re-

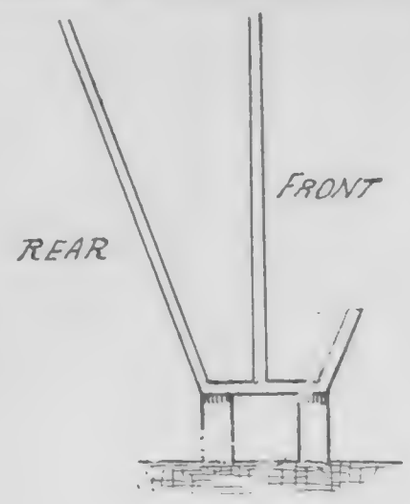

Fig. 285.

moved. To this mucilage may be added a fourth part of a solution of 10 grains of sulphate of zinc in an ounce of water, and two drops of wine of opium. When the eye is cleansed and this palliative injection has been used for two days, if the cloud remains, a pinch of burned alum is put into a goose-quill or small tube, and is blown into the eye. Burned alum is made by heating a lump of common alum on a hot stove, and after it has been freed from its water of crystallization by the boiling and bubbling, it remains a dry, pulverulent mass, which is easily reduced to a powder. A few repetitions of this will cause the absorption of the purulent deposit and will clear the eye. It would be well to give all the sheep the above-mentioned quantity of the soda hyposulphite, powdered and mixed with a little molasses, and spread on the back of the tongue, and to continue the treatment for a week.

Everywhere.

A SUMMER OUTING IN THE NORTH CAROLINA MOUNTAINS.

MARY WAGER-FISHER.

Why the place was selected; the journey southward; Bull Run; a fine country, where only men are lacking; general shiftlessness, dilatoriness and laziness; much new agricultural machinery; little or no attempt at home adornment; Danville; a negro king or preacher; fashion among the colored population.

JUST how and when my attention was first directed to the mountains of North Carolina as a desirable summer outing place, I am unable to say. A relative spent a summer in them in the region of Asheville: a dear friend had spent two winters in them for health's sake, and died in the second one; and a botanical acquaintance had heard tall tales of the richness of the flora at an out-of-the-way place called Highlands in Macon County, just north of the State of Georgia. So from one source and another, I had formed the intention to go thither when circumstances should insure me a generous length of time to spend away from home. At length it came about that early in the month of June, 1889, I set out with my laddie, a well-grown boy of twelve years, for the unknown region that from afar promised so many enticing features. Through correspondence a boarding place had been engaged for us in a private family, but of this we had no definite knowledge, except an assurance that our prospective hostess was a "very intelligent woman." That was a favorable promise, but when every one we met, who had been South, said to us: "Oh, you will find the mountains delightful, but you'll get absolutely nothing fit to eat, nor a clean bed to sleep in," the outlook was not particularly satisfactory. As usual, when the summer time came, I was thoroughly worn out, and I required everything that was most strengthening in food, air and wholesome surroundings, and it did look like a wild-goose chase to expect to find them in the mountains of Western North Carolina. Anaximander poked a little fun at the adventurous undertaking, hoped it would turn out all right, and started us off evidently with the expectation of seeing us back at the end of a month.

We went *via* Baltimore, Washington, Danville, Salisbury on to Asheville, and until Salisbury was reached, the heat of the weather increased as we proceeded southward. From Salisbury, a higher altitude yielded a fresher atmosphere, and from that point we suffered no further discomfort from the temperature. The heavy floods of the early summer had played havoc with the railroads for some distance beyond Washington, and for miles the cars crept carefully along, at great loss of speed. The railroad crosses the Bull Run battle field, and the conductor, who had fought on the Confederate side, pointed out to us that ill-fated ground. My oldest brother, who was also the eldest child in the family, had fought in that battle, and as he was brought home dead not long after that, the spot had to me especial interest. A little further on we came to Manasses, and some remnants of earth-works on the brow of a hill were the only suggestions we saw in our long day's ride through Virginia, of the stormy times of the Secession War.

There is a great deal that is attractive in the counties of Virginia through which we rode and the entire region, if tilled and cared for as are the farms in Central Pennsylvania, would nowhere be surpassed for beauty. But as spittoons appeared in every car seat the moment we left Washington, so evidences of the shiftlessness of the South became at the same time manifest. It may be a cranky notion of mine, but I cannot imagine a spitting tobacco-chewer, and a thrifty, tidy, tasteful, well-kept farm homestead as going together.

At various railway stations were new agricultural machines to be seen, which indicated a revival of agriculture under improved conditions. At one place where the train was halted for some time, I saw five negroes and two white men loading a large wagon with the detached parts of farm machinery, and the exceeding dilatoriness, and lack of energy in movement, that kept these seven men at a task that two Yankees unaided would have performed in the same length of time, seemed to explain a great deal of the shiftlessness that agriculturally characterizes the whole South. Rarely in town or country are there indications about the homes of the people of a taste for beauty. Green, well-kept turf in lawns, flowers and shrubs the scattered population seems to care nothing about, and unpainted country houses, with the outside chimneys at either end standing stark-bare, have a very lonely look, and they could be made so pretty with the native ampelopsis growing over them. The country is rolling; there is always the fine line of the mountains in the distance, there are noble trees left standing here and there, and the great lack alone is men—men of energy and good judgment, and, above all, of good sense, who do not look upon labor as ignoble, and do not regard the tilling of the soil as a plebeian occupation only suited to "niggers." Hands without brains do poor execution in any department of work, and particularly in a region where the soil for generations has been exhausted through mal-treatment, is the need of intelligence the more required.

When we reached Danville the shades of night had fallen, and we left the train to get a night's rest in a hotel. We were directed to a new one in which we found good beds and good food. Danville is sharing with Atlanta in a business revival, but the business is largely tobacco, the new, large brick buildings at every turn being warehouses for this especial Virginia product. Cotton ware-houses and cotton manufacturies, however, are projected, and the enterprise in business, I was told, was largely Southern. Danville has electric cars and electric lights with much of modern "go" in the atmosphere.

As trains on the Southern roads are like the people in being chronically behind time we had to wait 20 minutes next morning in the railway station. The waiting-room was carpeted and furnished with low rocking-chairs, and the larger part of the traveling public that morning was colored. An old man of pure negro blood, who was dressed in heavy broadcloth, with the addition of a beaver overcoat, which the state of the weather did not require, sat eating a luxurious breakfast from a tray in front of him, placed on a chair, while a colored waiter stood devotedly by fanning off the flies, which hovered persistently about an enormous wen which grew from the top of his head. When he had finished his repast and put on his shiny stove-pipe hat and consulted his gold watch he looked like a Prince of his race, and the marked attention which he received could only be explained upon the ground that His Majesty was a Baptist preacher. The colored women who were waiting for the train were smartly dressed in Directoire gowns and large hats; their babies were clad in Hamburg embroideries and showily lace-trimmed robes—all in the latest styles. Illustrated fashion journals evidently have a very considerable patronage among the colored people of the South. Everywhere they seemed to be more prosperous and more given to the vanities of this world than the "poor whites." But a planter confirmed my suspicion that the colored people had such a weakness for personal display as to lead them to spend their first and final dollar toward the accomplishment of that end.

RURAL SPECIAL REPORTS.

Oregon.

SPIKENARD, Jackson County.—The valley of the Rogue River is in the extreme southern part of Oregon. From its peculiar location and surroundings it has its own distinctive climatic conditions. It is drier than the Willamette Valley and there is more rain than in California. The Coast Range shuts off the ocean fogs. There is, perhaps, no finer climate anywhere. Our annual rainfall is about 25 inches. The mercury rarely touches zero in winter, or goes beyond 90 degrees in summer. The very best conditions here exist for fruit culture which is largely carried on. All except the citrus fruits are raised in perfection. Grain and stock are largely raised. Hogs and corn, beef and butter, poultry and eggs all pay good dividends. No swine plague is ever heard of, nor is poultry ever affected with cholera. Alfalfa is at home on our soil, often producing eight tons of hay per acre, being cut three times during the season. Where the land is irrigated, four crops are often secured. Though we do not make much noise in the world, we have just as good a country as anybody. We don't "boom" our country because we know by observation that to boom is to kill. Merit, only, will win in the end. Land is worth a fair price and only those who can buy a home should think of coming. I am not after immigration; I simply desire to contribute to the knowledge of geography of the readers of the R. N.-Y.

Of course, Oregon has her own flora. Some one has called her the "emerald land." She is, too, the "flowery land." Many of our native plants are catalogued with a great deal of trumpeting, but not more than they deserve. Our lilies, the most popular of which is the Washingtonianum, are among the floral gems of the earth. No one of the whole queenly family is more beautiful, fragrant and popular (at home) than this. It is vexatious to see it catalogued as a California variety when it is indigenous to only a small portion of that State next to us. I have presented it to many a Californian. The calochortus, erythronium and our several fritillarias are other fine plants dear to florists. S. M.

COMPOSITION OF LATE-GROWN GRASS.

J. H. S., Spring Valley, N. Y.—This year there have been many complaints from dairymen about here to the effect that, while the pastures kept green unti fall, the quality of the late grass was very poor. Have any chemical analyses ever been made to show that there is any difference between the first growth of grass and that which comes later in the season? If there is a difference dairymen should know it and supply other needed foods.

FROM PROF. E. F. LADD.

I have made analyses of a few of our grasses from different cuttings, always at the same stage of growth—full bloom—and I have generally found each successive cutting more nitrogenous than the preceding one. I have found this true for four successive cuttings of Alfalfa and for two crops of mixed grasses. Second-crop clover is considered best suited, fed in small quantities, for young calves and lambs as they come to the barn for winter. By analyses we find such wilted grass to have a larger per cent. of albuminoids than the first crop. The chemical composition of the dry matter from the mixed grasses for the two cuttings was as follows:

	FIRST CUTTING.	SECOND CUTTING.
Ash	5.69	7.55
Albuminoids	9.25	13.25
Crude fiber	41.51	39.40
Nitrogen-free extract.	40.37	36.12
Fat	3.18	3.68

In general, then, we may say that the second and subsequent crops of grass are more nitrogenous than the first.

My opinion is that the poor quality of the late grass is due not so much to the chemical composition of the dry matter as to the condition of the grass. The fall has been a wet and cloudy one and every cell of the grass has been fully distended with water and in addition considerable surface moisture has been present most of the time. An animal in order to secure the necessary amount of dry matter to sustain life and produce milk has been forced to consume a bulk beyond its capacity. Such an animal may be filled up, but is not fed—only stuffed. To illustrate; in an experiment with corn, as a forage, cut at the period of tasseling this season, I found by analysis 91 per cent. of water and that it would be necessary for a 1,000-pound cow in full milk to eat 300 pounds of this stuff per day in order to have the full amount of dry matter called for by the German feeding standards. From the few experiments made I question whether the dry matter of grass grown under such conditions as have existed this fall, is as nutritious as that in more favorable seasons, especially as regards the so-called nitrogen-free extract. The supposed poor quality of grass the present fall is probably due to the presence of an excessive amount of water in and on the grass, making it necessary for the cows to overburden their stomachs with a mass of wet grass ill suited to their needs as butter producers.

Geneva Experiment Station.

FROM PROF. W. W. COOKE.

So far as I know, we have never made any analysis at this station that would bear on that point. Reasoning from general principles of plant growth, the first grass of spring having a larger store of plant food at its command, should be better in quality than that which grows in the later part of the year.

Vermont Experiment Station.

FROM DIRECTOR G. H. WHITCHER.

I cannot give any analyses further than to state that there is doubtless a decrease in the nitrogenous part of the food as compared with the non-nitrogenous. We are now making analyses that will indirectly bear upon this matter, but not so fully as if we had planned for it. We practice feeding largely of corn-meal in early summer as a supplementary food and as the season advances we put in more of middlings and still later gluten or cotton-seed meal. Pasture feed alone will not keep up the milk flow as New Hampshire pastures run, and hence as milk falls off, the wide-awake dairyman adds grain and keeps up the product: the shiftless dairyman lets his cows "work their passage" and contents himself with the thought that is too prevalent, namely, that cows need a chance to cleanse their systems from the evils that follow grain feeding in winter and that this is best accomplished by withholding grain until they again come to the barn. The result is dry cows at housing time, and no income during the months when prices are the highest.

N. H. Experiment Station.

CHEESE.

H. C. B., Westernville, N. Y.—A local paper contains a statement concerning a Mr. Ryan, who is said to be "engaged in obtaining options for the purchase of cheese factories in various counties in the Central and Northern part of the State. He reports that he is getting along in an encouraging manner. He expects that he will get options on about 50 factories in Oneida County. He wanted to have it understood that he was not representing any English syndicate. He was representing for the present no one but himself. Of course, if all these cheese factories are purchased, it will require considerable money, and it is likely that a syndicate will furnish it. Whether the capital will be furnished by Englishmen or Americans Mr. Ryan says will not be determined until later on. The owner of the factory in each case agrees that if the option is accepted he will not engage in the manufacture of cheese elsewhere in that locality and that he will assist the purchasers to make a success of the enterprise. The value placed upon the factories ranges from $500 to $5,000, according to their size and equipment."

How does the RURAL NEW-YORKER think such a plan of bringing a number of factories under one management will affect the milk-producers' interests? Would a backing of English capital tend to lower the price of cheese?

ANSWERED BY PROF. H. H. WING.

So far as it has come under my observation, those localities seem to be most prosperous where the cheese-making is done on the co-operative system; *i. e.* where the patrons themselves own and operate the factories. The plan of bringing a large number of factories under one management need not affect the interests of the milk-producers otherwise than favorably, as numerous instances of the successful management of such combinations, notably the "Marshfield" and "Cloverfield" combinations in this State, testify. The main advantage of this combination system lies in the strict superivsion of all the factories by some one interested in the output of the whole. This insures a better and more uniform product, which in turn brings an advance in price and a greater profit to the producer. I am not one of those who look with alarm upon the large amount of English capital that is now seeking an investment in American manufactures of various sorts with a probable view to a monopoly of the output. It is only a very few years ago that John Bull attempted to "corner" the great American steer on the Western plains, and we all remember how soon the British lion tucked his tail between his legs. It seems to me that the result of the attempt to control American beer, flour, and cheese can be scarcely more successful. In my opinion, the one great thing that keeps down the price of New York State cheese is its miserably poor quality. It not only lowers the price, but it materially decreases the consumption. It is with shame for my native State that I am compelled to say that it is next to impossible to buy at any price, in our local markets, a piece of cheese of even fair, not to say first quality. We have allowed the Canadians to crowd us out of the English markets, and were it not for the 15 per cent. tariff, the retail grocers of Little Falls and Utica would in all probability be selling Canadian cheese. Our makers have only to educate themselves a little more and give a little more labor and pains to their work to enable us to bid defiance to the cheese, the capital, and the competition of any other country.

ABOUT MANURE.

L. W. R., Benton Harbor, Mich.—I have a quantity of horse and cow manure which I propose to mix, and intend to use in the hill in melon culture next year. 1. Can I add chemical fertilizer which will increase the value of the manure more than the cost of the fertilizer? If so, what kind—*i. e.* what elements should predominate, and how much shall I use to each two-horse load of manure? 2. Is manure from animals bedded with sawdust and shavings of oak and elm worth as much as it would have been had the animals been bedded with straw? If not, why not? Has the acid contained in the wood a deteriorating effect? 3. I bring most of the manure used on my farm from town; this has never been re-handled, so that much of it is "fire-fanged" and very light and fluffy. The fathers' idea was that such manure had lost much of its value; while a recent writer in the R. N.-Y. says it has lost practically nothing, except "the water and a little ammonia; but a little of this makes a great smell." What does the R. N. Y. say to this? Does manure lose by heating? What, and how much?

ANSWERED BY DR. PETER COLLIER.

1. Stable manure is, in my opinion, as near what is termed a complete manure as we can get. I know of nothing which can be added to it which will enhance its value beyond the cost of the manure and the fertilizer added. 2. The average of the several kinds of straw, according to the tables of Professor Wolff, gives 5.61 per cent. of ash, and of this ash there is an average of 26.7 per cent. of potash, and 6.9 per cent. of phosphoric acid; while the average of many kinds of wood is 1.15 per cent. of ash, of which 15.5 per cent. is potash and 8.1 per cent. is phosphoric acid. It will be seen therefore that straw contains a much larger amount of plant food than does sawdust, but owing to the fact that sawdust is such an excellent absorbent for the more valuable liquid manure, its use in the stables as bedding is to be highly recommended. Recent careful experiments at the station show the average market value of the phosphorus, potash and nitrogen in the solid dung of the cow, fed upon a mixed ration, to be nearly four cents per day, while the value of the liquid manure was over six cents a day and together they were over 70 per cent. of the market value of the food fed. 3. I do not know what loss manure sustains by fire-fanging, but I do not believe it to be very great. We hope to settle that question by careful experiments in the near future. A common but very mistaken idea prevails that the offensive odors of the barn and yards are due to ammonia or its compounds. This is rarely if ever the case.

PETROLEUM AS A WOOD PRESERVER.

G. D., Carysville, Ohio.—1. Which is the best method of applying crude petroleum to fence posts in order to render them more durable? I have contracted for a quantity of oil for the purpose of experimenting with it upon fence posts, and want to know what are the best means of applying it. Should the oil be heated or applied in a cold state? 2. What kind of paper does the R. N.-Y. prefer that its correspondents should use for manuscript?

ANS.—1. A painter of over 30 years' experience gives his views as follows: "It will not be beneficial or safe to heat petroleum oil. It has great penetrating powers without heating. As it is a light oil (with no body) it is not much of a wood preserver when the wood is continually exposed to the weather unless a film or an enamel after dipping or painting, is applied by painting the surface to make it impervious to air and water. I have just examined a neighbor's fence posts that were first dipped in a trough containing petroleum, then the bottoms of the posts were dipped in gas-tar which forms the enamel. These posts (oak) had been set 15 years. They were sound and in a good state of preservation. Gas-tar sticks best to such surfaces as are first filled with petroleum or paint. Where there is no film or enamel petroleum does not preserve the wood. 2. Paper just one-fourth the size of this page is easily handled by editors and compositors. Most writers use sheets that are too large. Of course, you will write on one side only!

TESTING MILK AT CREAMERIES.

Several Subscribers.—At the Wisconsin creameries is any system of testing milk used? What about the fairness of paying patrons on the basis of the amount of fat in the milk?

ANS.—This question has been referred to some of the best Wisconsin creamery-men. Here are two answers.

FROM J. M. ANDREWS.

We have the Curtis oil test for milk; also Short's method, both of which we use for testing milk delivered by the patrons. I think Short's method the more reliable for milk: but for creameries run on the gathered-cream system, the Curtis oil test is better, and most of the creameries operated by that system pay by the amount of fat in the cream. The only objection I have to it is that it is almost impossible to make a test of the product from 50 or 75 patrons without breaking several bottles.

Fort Atkinson.

FROM H. K. LOOMIS.

The creameries in this State generally take the milk and run it through separators and the milk is tested by Short's method. A few creameries in the State gather cream and I think they generally use the oil test. There could be no objection to a careful testing of cream, and a system of payment based upon the amount of fat in it.

Sheboygan Falls

MUCK.

R. W. H., Jasper, N. Y.—I have a large swamp of black muck; I can run a stick down 10 feet and easily withdraw it again. Is this valuable for fertilizer? If so, how can it best be used?

ANS.—Probably the muck is valuable but just how valuable it is can be determined only by an analysis. It may be said that what is commonly termed "muck" varies in fertilizing value almost as much as do different brands of fertilizers. Doubtless you can make arrangements to have the muck analyzed at the New York Experiment Station at Geneva, N. Y. It is safe to say that almost any light soil will be benefited by a dressing of muck. It may be hauled out of the swamp and spread over the surface like manure and plowed in. We have hauled many loads of muck to the barnyard and mixed it with the manure. It also makes a fine absorbent in the stable; while, made into a compost with night-soil, it makes fine manure.

WARMING WATER FOR STOCK IN WINTER.

G. W. S., Parishville. N. Y.—Will it pay to warm water for milch cows in the winter where they have to go out-of-doors to drink?

ANS.—This will depend on the cost of warming the water, and this cost will depend upon the amount of water needed, the price of the fuel, the facilities for securing water and the location of the tank or drinking place. Try an experiment with a few of your cows; give them warm water to drink and treat them in other respects just as the other cows are treated. You can then see what the warm water is worth. Experiments with the warm water give no satisfactory results. The Minnesota Station found little or no benefit from warm water, while the Wisconsin Station records a little profit from its use. The R. N.-Y. can give an opinion only, and that opinion is that for cows in warm, tight barns water directly from the bottom of the well is best at all seasons.

A FRUIT LADDER, ETC.

F. K. P., Delavan, Wis.—1. How long can a good, portable fruit ladder be made, and what is the best pattern? 2. How long can a good fruit-picker or tree-pruner be made and work well? 3. Is there a good pocket pruning saw?

ANS.—1. The best portable fruit ladder is the one made by splitting and spreading a light pole of spruce or cedar, not over 12 feet long, driving an iron ring about one foot down from the small end and putting a bolt through the ring and pole. The pole should be split with a saw up to this ring, the divided parts spread open so as to be 18 to 25 inches apart at the bottom, and the rungs put in at the proper distances for convenience, say nine inches. 2. About 10 feet. 3. No.

Miscellaneous.

W. H. R., Oakville, Canada,—A. J. Caywood & Sons, Marlboro, N. Y., sell the Minnewaski Blackberry.

A. H. H., Raysville, Md.—We propose to treat the subject of hedges exhaustively within the next few weeks.

J. F., Danville, Ill.—Is soot valuable as a fertilizer and insecticide?

ANS.—We certainly regard soot as a very valuable fertilizer, and believe it would also be of great value as an insecticide.

W. D., Burlington, N. J.—Can I raise a crop of white potatoes on meadow land by mulching with hay or straw? The meadow is too full of weeds to raise grass.

ANS.—We doubt if a profitable crop can

be so raised; that is, if we understand the question.

J. M. S., Rutland, Pa.—Where can I get registered swine?

ANS.—What breed of swine? Here are the names of a few breeders: F. D. Curtis, Charlton, N. Y., Duroc-Jerseys; C. H. Warrington, West Chester, Pa., Chester Whites; S. E. Shellenbarger & Co., Camden, Ohio, Poland-Chinas; Springer Bros., Springfield, Ill., Berkshires; W. Atlee Burpee and Johnson & Stokes, Philadelphia, Pa., various breeds.

J. G., Carbondale, Pa.—What is the best work on the care of horses and mules. I have charge of a large number of mules here, and the legs of nearly all of them are in a terrible condition.

ANS.—For diseases of farm animals there is probably no better book than Law's Veterinary Adviser, published by Dr. James Law, Ithaca, N. Y., price $3. This probably will not give all that you wish about the handling and feeding of the mules. We do not know of just such a book as you want. A good one could be compiled from the columns of the R. N.-Y.

A. H. B., Chicago, Ill.—How can I convert oak leaves, now falling, into manure in time for use for next season's crops of grass for pasture and hay?

ANS.—The leaves can be scraped into piles with rakes or by other means. They make good bedding or can be used in the manure heap. They can be converted into good compost by rotting them down. To do this properly, something must be mixed with them to hasten decay. Night-soil or some similar manure is excellent for this purpose; in fact, about the best use for night-soil is to serve as a composting agent for muck, leaves or similar material. In the absence of manure, lime is often used to start the rotting with quite satisfactory results. A layer of leaves about a foot thick, then lime enough to make them white, then more leaves and so on. The best place for leaves will be found in the stable or on the manure heap. As a rule, the R. N.-Y. doesn't believe it pays to collect leaves.

Discussion.

MORE ABOUT THE COST OF LIVING.

FRED. GRUNDY, CHRISTIAN COUNTY, ILL.—Here is a partial list of family expenses for each adult in 1888.

Flour	$5.90
Cereals, rolled oats, pearl barley, etc.	1.85
Meat, largely fresh beef	7.55
Sugar	4.75
Tea and coffee	1.62
Wood and coal for two stoves cost	18.60
Family supply of kerosene	4.10

Flour is bought by the sack from the large flouring mills in the village at $2.60 to $3 per sack of 98 pounds. Coal is shipped in on the railroad and we buy it by the bushel, a full supply of mixed nut and lump for winter being laid in, at 7½ to nine cents per bushel, some time in October. Meat is bought mostly from regular butchers at eight to 12½ cents per pound. We buy some from farmers who butcher beeves of their own raising, and sell by the quarter or 100 pounds to neighbors at 4½ to eight cents per pound. Eggs, butter, chickens, vegetables, milk and the greater part of the fruits used are produced on the place and no account of them is kept. We burn quite a lot of corn-cobs in the cook stove in summer because they make a hot fire quickly and it is soon gone. Very little molasses is used because we find it so very difficult to procure a thoroughly good article. Most of the stuff usually sold as molasses or sirup would destroy the stomach of a rhinoceros, if the animal could be induced to eat it. Boots, shoes, clothing, etc., cost about the same here as in any village between New York and Omaha.

C. F. H., CLARKSVILLE, MICH.—THE RURAL NEW-YORKER of Nov. 2, asks the following question: "What is the cost of living in your neighborhood?" If this question could be answered correctly or even approximately, it would be shown that a wide difference existed in the cost of living in families of equal numbers and means in this neighborhood, not only in the aggregate outlay, but also in the use and consumption of different articles of diet and dress. Our family comprises three adults. Below will be found a table of our expenses for the past three years and 10 months, beginning January 1, 1886.

	Sugar.	Groceries	Meat	Light	Tea.	Coffee	Cloth'g.
1886	$30 03	$14 50	$21 20	$8 76	$2 94	$6 50	$31 06
1887	8 10	25 41	2 55	5 50	3 10	7 00	36 74
1888	9 43	15 97	37 10	4 0	3 80	6 25	44 87
1889	26 10	25 33	21 71	3 52	2 15	25	33 50

For many years past I have kept strict debit and credit accounts of all receipts and expenditures in trade—before and since moving on a farm—hence I am able to give a very correct statement of our family expenditures. I have separated from the general grocery account the items of sugar, coffee, tea and kerosene. In addition to the sugar purchased, we have used about 100 pounds of maple sugar, each year, manufactured on our premises. Also, to the meat account must be added about 250 pounds of beef of our own slaughtering each year, except 1887. The consumption of pork has been principally hams, as we have not had a hog on the premises since 1884. The expenditures for clothing include shoes, etc., which have been for two members of the family only—wife and myself. It will be observed in the above table that no account is made of the amount of flour, fuel, fruits, vegetables, butter, milk, eggs and fowls consumed, as no direct outlay of money is made for those articles. About 18 bushels of wheat manufactured into flour for family use, and about 15 cords of wood are consumed per annum. It will be noticed that the item of sugar has cost this year more than double the outlay in any previous year. This is one of the consequences of protected trusts rather than of an increased number of pounds purchased. My farming experience is limited to the last seven years, and as the farm labor has been done by experienced farmers for a share of the crops, I have not hired much outside labor—not enough in the years above enumerated to add materially to the expenses.

W. S. S., PLEASANT VALLEY, ILL.—I believe the R. N.-Y.'s idea of collecting estimates of the cost of living in different parts of the country might prove very valuable to town people who think of trying country life. Our family consists of four adults. We produce all the flour, meal, potatoes, milk, butter and vegetables we use and most of the meat, fruit, etc. We use very little smoked or salt meat, but patronize the butcher's wagon in the summer and butcher for ourselves in the winter, or buy beef by the quarter and keep it fresh, selling it so to the neighbors when we butcher. For the past five or six years our average yearly outlay for dry goods for the family has been $100, as nearly as I can figure it from our accounts. For groceries $70 or $80; for meat about $15 cash paid out; coffee and tea $5 to $10, and sugar, honey, etc., $20 or $25. These latter items are not reckoned with the other groceries. Our fuel costs nothing but the labor of cutting and hauling 80 rods or so, as this is a timbered part of the State. Our real estate tax runs from $2 to $15 on each 40 acres per year. I haven't any accounts very far back so as to be able to compare the cost of living then and now; but the expenses for the past five years or so have been quite uniform: $300 per year will cover the whole, including repairs, blacksmithing, postage, and all the other little leaks; but not including the price of stock, machinery, etc., for the farm.

S. B. W., RIVER FALLS, WIS.—Our account is rather meager, and has been kept with the idea of knowing the total amount of our expenditures rather than the cost of each item. For the year 1888 my outlay for two adults—no children, but some help hired by the day, but none by the month, no account being kept of flour, vegetables, meat, fowls, eggs, butter, milk and cream—was as follows.

Groceries and dry goods	$108.07
Sugar	15.00
Wood estimate	50.00
Total	$173.07

The above is an estimate of what we "stayed on" rather than the cost of living.

R. H. T., NORTH RIVER, N. Y.—I have never kept an account except of flour, pork, sugar and tea. Butter, cream, eggs, vegetables and potatoes I raise myself. I have my own wood, so all the cost of it is that of cutting and hauling it and we do that by odd jobs. There are eight of us in the family. This would be for each member about $26.43 per year, or about 51 cents per week.

We consume 12 barrels of flour at $6 per barrel	$72.00
6 barrels of pork at $16	96.00
500 pounds of sugar at 7½ cents	37.50
20 pounds of tea at 30 cents	6.00
Total	$211.50

A YOUNG FARMER'S IDEAS AND PRACTICE.

W. L. J., SOUTHPORT, N. Y.—I have long had it on my mind to tell the R. N.-Y. how much I appreciate it. Of the six agricultural papers I subscribe for, the R. N.-Y. is the one I can least do without, and so long as it is kept to its present standard it may count on my hearty support. I am a young farmer and try to be a progressive one. I cannot claim, like T. B. Terry, to have made my farm, for I inherited it; but I try to make both ends meet and 'lap on' "some." My farm contains about 35 acres of sandy loam, from which I support a family of eight persons, and we have many of the luxuries of life. I have a large new barn, (not built from the profits of the farm) 60x46 feet with 18-foot posts, which I fill from my small farm. I keep three horses, 10 cattle, a number of hogs and about 100 hens. We make butter the year around. I feed my cows bran four parts and cotton-seed meal one part, with good pasture and corn-fodder through the summer. In the winter I feed equal parts of corn and oats ground together, with roots (carrots, mangels, turnips and small potatoes) and good hay and corn-stalks. I have warm stables for all my cattle. I keep one man the year around. I believe in fall plowing, and follow mixed farming. My rotation is about as follows: a Timothy sod with 18 to 20 loads of barn-manure per acre spread on and plowed under in October or November when it is allowed to lie rough till spring. Then I apply 500 pounds of kainit per acre, thoroughly cultivate and plant to corn May 1 to 15. This is followed by potatoes or oats, and the ground is seeded to grass with wheat and mown for three years, then pastured and plowed again. I plant potatoes on the trench system, using 2,000 pounds of commercial fertilizer per acre broadcasted after the ground has been trenched. In the season of 1888 I raised 406½ bushels of potatoes per acre, true measure. My money crops are potatoes and hay. My grain is marketed in the shape of milk, cream, butter, chickens, eggs and pork. Our village being a summer resort for wealthy city people, we get extra prices for the products of the farm. I make all the manure I can, and buy as much as I think I can use with profit. I believe the proper time to apply manure is whenever one has it.

M. M., MINNESOTA LAKE, MINN.—Our family numbers five adults—two men and three women—and the yearly cost is as follows:

Wheat ground for flour	$42.90
Butcher's meat	38.00
Fowls	9.50
Sugar	25.50
Home-made sorghum sirup, 40 gallons @ 20 cents	8.00
Tea	8.00
Coffee	18.25
Fruits, baking powder, vinegar, etc.	21.00
	$171.15

Wheat, meat and fowls are put down at the figures we could get for them if we sold them at the time we used them. Of the cost of potatoes, buckwheat and all sorts of vegetables we did not keep any account. Wood we have to buy here. Last year's supply cost $20, and we had to haul it 18 miles, which made 10 days' work for one man and a team. Clothing came high:

Clothing for one man	$37.75
Boots and shoes for ditto	18.50
	$56.25
Clothing for one woman	$36.90
Shoes " " "	10.25
	$47.15

We live and dress in the same way as a large majority of the hard-working people in this county.

CORN FODDER.

C. S. RICE, LEWIS COUNTY, N. Y.—Reading the note concerning the R. N.-Y.'s corn fodder experiment, mentioned on page 760, leads me again to refer to a matter I have discussed before. From 20 to 30 tons of corn-fodder can easily be grown on one acre of land. A dairy of 30 cows will profitably consume several acres of such fodder each season before the usual time of opening the silo. Labor is not plentiful, wages are high and the prices of dairy products are low. It is therefore well worth the study of the dairyman to cut, cure and place before the cows this heavy crop with the least possible labor and at the same time secure fodder of the best quality. About two years ago I gave the readers of the R. N.-Y. some account of a method that I had practiced with perfect satisfaction for years, and under varying conditions of crops and weather. Experience since that time has only confirmed my previous opinion of its practicability and value. Many farmers have tried it with success and have commended it for general practice, while others have made a partial failure. Without attempting to account for such failures or compare my way with the practice of others, I will give a brief account of my way of cutting, curing and feeding this year's crop.

The variety of corn is known here as Sheep's-tooth. A little more than a-half bushel of seed to an acre was drilled in on six acres of good, well-manured corn land. The rows were 32 inches apart. The crop was cultivated three or four times and grew to the hight of from nine to 12 feet. There were some ears on the thinner portion of the field. It was cut the first week in September. It had been in tassel for some time and the ears were about in condition for roasting. The corn stood up well, and it was cut with the reaper two rows at a time. The piece was divided in the middle, and the reaper cut on all sides so that no time was lost. An average of five hours' time of two men to the acre completed the job of cutting and cocking the fodder. The rakes were allowed to run but not to throw off the corn. When the platform was well loaded the team was stopped and the corn was drawn off by hand. The bunches were large, containing about 400 pounds each and were left in rows. The corn was handled with the hands and five or six of the bunches were put in each stack. The stacks were made 10 feet across on the bottom, and as high as the men could place the armful—say, six feet.

About one ton of the green fodder was put in a stack. The work of cocking was begun as soon as cutting was completed. There was no rain during the whole time. The armfuls were crossed occasionally; the cock was kept in good shape and finished by the two men, one on each side, bearing down the ends of stalks that they might at once take proper shape to shed rain. The week after the cutting it rained nearly all the time and has done so perhaps every other day since. The rain has never penetrated the cocks to any extent. Only one or two tops of cocks have been blown off. There has been no heating, souring or molding. The fodder is in perfect condition from top to bottom except a little that is weather-beaten on the surface. Although the stalks are large the cattle eat them with a relish and perfectly clean; there is no waste whatever. It is as good corn-fodder as I ever saw. A large feed of it has been given the cows once a day from the time of cutting.

The stalks are long and although a hay knife was used to cut them up so that they could be pitched from the cock to the wagon, still it was hard, heavy work to load them. The men now load them with the team in less time than when it was done by hand and there is no lifting whatever. A low, broad-tired wagon with a hay rack that is eight by 16 feet in size, is placed near the cocks and the team is removed. Three planks are laid from the ground to the hind end of the rack and with an inch rope 60 feet long the cocks are drawn up the plank and a load as large as the team can draw is put on in a short time. A large iron ring is attached to one end of the rope for convenience in forming a noose. The rope is passed around the cock part of the way under the edge and part of the way a foot or more up on the side and the end is put through the ring and the team is attached. The rope when drawn tightly holds the entire cock firmly like a bundle, and it is drawn up the plank and forward on the rack. Enough cocks are then drawn on to form a load as large as the team can draw. Such a load will last my stock five days and it is thrown direct from the wagon in front of the cows. As there is another wagon for farm work the stalks are unloaded only as they are needed and all extra handling is avoided.

The harvesting and curing of corn-fodder and feeding it from the first of September to the first of January can be done in this way with perhaps as little labor as by any method that can be devised. The quality of the fodder is excellent. Corn for curing in this way should be sufficiently mature when cut. The cocks should be made of a size according to the length of the stalks. If a large cock is made with short stalks it will probably become wet. If in the case of corn-fodder 10 feet long the cock be but three feet high, the ends of the stalks will rest on the ground and the stack cannot take the conical form necessary for shedding rain. I have enough of such fodder now in the field to feed the stock once a day until February and I intend to continue to feed it direct from the field while it lasts.

Miscellaneous Advertising.

"Herbrand" Fifth Wheel for Buggies

Past experience warrants the belief that this can be done conveniently and with little or no damage to the fodder.

POTATOES AND OTHER POINTS.

W. C. S., HARMONY, R. I.—On page 712 of the R. N.-Y., A. L. Crosby speaks of the Rural Blush Potato as improving and being more sociable. I have planted this variety ever since the little potato was first sent out by the R. N.-Y. and have found it to vary considerably as regards the spreading habit of the tubers in different years and in different soils the same year—especially this year—and I believe its conduct in this respect is due to the preparation of the ground, and to a less extent to the character of the soil, rather than to the location of the fertilizer for the following reason: This year I attempted to imitate the R. N.-Y. Trench System to some extent. The ground was plowed in the fall and manure was spread on in March. The soil was harrowed and plowed twice before planting in the spring. On May 7, the ground was furrowed out: I went twice in a row with a 2½ conical plow and then went through the rows with a harrow made for the purpose, leaving a level seed-bed 10 inches wide and very fine, about six-inches below the level of the field. Three-eighths of an acre was prepared in this way; three-eighths more was simply furrowed out once in a row. Part of the field was a light sandy loam gradually running to a rising gravelly soil. Both pieces were planted the same day mostly with the Rural Blush Potatoes. On the sandy loam and in the large furrows they spread as badly as ever. I measured some stems having a potato each on the end, that were 16 inches long, and it was slow digging to get them clean, but as I got on to the gravelly ground and single furrows the potatoes were more concentrated in the hills; the harder the ground, the closer the potatoes grew.

On this same piece of ground fertilizers were applied in different ways. On one-quarter of an acre 200 pounds of the Mapes Potato Fertilizer were broadcasted and 200 pounds were spread in the furrows after the potatoes had been dropped and covered with about one inch of fine earth; on one-quarter of an acre 400 pounds of Mapes Potato Fertilizer were broadcasted; on one-quarter of an acre two cart-loads of hen manure were broadcasted and all were well harrowed in before furrowing. There was but very little difference in the yield of the same variety. What little difference there was I attribute more to the difference in the nature of the soil than to anything else; but there was a large difference in the looks of the vines at the first and second hoeing; but all gradually came nearer together at the close of the season. A part of the first quarter of an acre was planted with different varieties which I expected to yield a very large crop; but a man who plants potatoes is liable to be disappointed as the R. N.-Y. well knows. The varieties I planted were one-half a bushel of Thorburn's Early, in 577 hills; one-half bushel of the Rural New-Yorker No. 2—lacking one pound which I had sold—in 454 hills; and three pounds of the Great Eastern in 64 hills. All were planted as nearly one foot apart in the rows as possible without exact measurement. The rows were three feet apart. The Thorburn planted 123 hills more than the Rural New-Yorker No. 2; the tubers not being so large but having more eyes. On August 5, the Thorburn vines began to turn yellow at the ground as though they were getting ripe. The rest of the vines were green and very handsome, having been kept very free from bugs and weeds. On August 12, blight struck them and in three days the whole field was black and the vines were slippery. I commenced digging the Thorburns at once. I picked up 18 measured bushels, leaving about two bushels rotten on the ground. The three pounds of Great Eastern produced 2½ bushels all picked up. The Rural No. 2 yielded nine bushels all picked up. The last two varieties were very green as the skin slipped very badly. All three varieties rotted very badly after they were dug; so that I have saved only four bushels of the Thorburn; one bushel of the Great Eastern, and 5½ bushels of the Rural No. 2. The latter rotted somewhat since they were put in the cellar. The Rural Blush was left in the ground three weeks longer before it was dug, and to my surprise there were but a very few rotten, and the crop is keeping all right. I was very much disappointed in the Rural No. 2 Potato. When I planted them six large potatoes were dry-rotten so that I got only one and two sprouts from a potato; nine had large hollows or were false-hearted. The vines did not look thrifty, and there were very few to a hill, many of the hills not having more than one or two vines. They were very large and close to the ground with a few small branches growing from them. The potatoes were of good size and had the blight not struck them, I think that without a doubt they would have been very large. The quality is good, but as they were not ripe I cannot say much about this point.

A PLEA FOR INTELLIGENT FARMERS.

E. F. D., LIMA, N. Y.—The letter of H. S. W. on the first page of number 2076 pleads for more intelligence on the part of the farmer and I would heartily second his plea. With our present system of free schools, our newspapers published by the million and books at a nominal price, there is no reason under heaven why the farmer of to-day should not be an intelligent man.

This is an age of progress, of advancement. The merchant who stands at the head of his line in the city is the educated, reading man. He knows when and where to buy and when to sell. He is conversant with the prices of silk at Lyons and of cottons at Manchester and Lowell. The commercial bulletins, price currents and various trade papers find their way to his desk daily. He studies the law of supply and demand. He keeps posted as to the stock of his competitors. While others sleep, he is awake. While others cry "hard times" and waste their time in waiting for customers, he acts. He is prepared for emergencies; he advertises, marks down prices, throngs his store with customers and success crowns his efforts. The times demand farmers modeled after this merchant. They must be educated. They must read. They must keep abreast of the onward sweep of invention. They must study their soils. They must keep a finger on the pulse of trade. They must be familiar with the contents of the store-houses of Europe and Asia. They, too, must watch the supply and demand and then prosperity and independence are theirs.

This discussion about Montana touches a subject that interests nearly every Eastern farmer, and that is: Why go West? Is the soil more fertile? Is the climate more salubrious? Are the chances for a better society and for better education for your children to be found there better than in the East? Oh, no. Despite the attractions held out by the railroads; despite the descriptions of the Western Paradise given by oily-tongued, unscrupulous land agents; despite the glowing accounts of the West's prosperity published in its local papers; despite the wonderful crops of corn in Kansas, and of wheat in the Dakotas, the Western farmers are bearing heavy burdens that we know nothing of, and there are thousands of them this very day in every Western State and Territory, who wish themselves back on the old farms in the East. Some seem to think that it does not cost anything to get a farm in the West. To such I submit the following: The president of one of the largest mortgage investment companies doing business in the Dakotas, writes that it costs about $3,000 for the Eastern farmer to get 160 acres of prairie land under good cultivation. It takes two years at the least to do this, and the living expenses of an average family of five during this period are something enormous. I know of a farm of 150 acres, two miles from a New York Central Railroad Station, 350 miles from New York City, that will produce with ordinary cultivation 3,000 bushels of potatoes, 600 bushels of wheat, 500 bushels of oats and 20 tons of hay annually, that can be bought for $4,500. The buildings are old but comfortable, and a wind-mill forces water into the house and then to the barns. That farm is certainly cheaper than a quarter-section in the West, and I presume there are hundreds of farms throughout New York just as cheap. I would reverse Horace Greeley's words, and say: "Young man, go East." The East has many advantages over the West, so why not stay here? Do your best; that is all that God asks of any one.

WHO USE SILO WEIGHTS?

JOHN GOULD, PORTAGE CO., OHIO.—With the merits or demerits of Mr. Colcord's patent system of making silage I am not personally familiar, and so far as I know, it may be exceedingly valuable, but Mr. Colcord should not attempt to make out a case of economy for it by bringing in a contrast that has no existence, so far as I know, west of the Alleghany Mountains. People may yet be cutting half-grown silage fodder in the East and putting tons of stone on a double-planked silo cover; but I have no knowledge of any locality in the West where the remark that it will cost more in time and money to weight silage than to use jack-screws will apply. In fact, I do not know of a man who weights his silage, and but few go beyond a cover made of tramped straw or marsh hay, a foot thick. This simple cover is put on three days or so after filling the silo, and we now hear very little of silage moulding on the surface, or being damaged in the corners. This straw cover, without boards or weights beyond a few old rails to assist in making the straw mat down, allows the warm, moist air to escape, but prevents the upper air from coming in contact with the silage, and this is all that one needs in making "sweet silage." Some do not even cover the silage with anything, especially if feeding is to commence within three or four weeks from the filling, which is now a very common practice in Ohio. Some commence to feed from the silo the next day after filling. When the silage is left uncovered for four weeks, after it has been put into the silo, there will not be over two inches of mould upon the surface, and young stock will eat about all of this if they are permitted to have access to it. Two pits of silage near here were left wholly exposed from May to August, and there was less than three inches of mould upon the surface. There must be a better presentation of Mr. Colcord's case in the West than that set forth by the assertion that "jack-screws are cheaper for pressure than covers and weights," for silo men cannot see what either of the three has to do with making the finest of sweet silage.

Moreover, a good many of our leading silo men will smile on reading that with some patent they would be enabled to take out more tons of perfect forage than of imperfect silage, when the loss from all causes by their plan of siloing thinly-planted, fully mature-fodder, will not exceed one ton to 100. When farmers by their latest plans of siloing fodder and cheaper yet better silos, can put in silage for 18 to 30 cents per ton, and have it keep sweet and fresh for a year, it will be hard work to introduce an improvement that will cost them as much as their present plant has cost them; but as they have hitherto readily adopted the best way that could be found for handling silage they will be likely to avail themselves of all new improvements; hence it is not impossible that the "governor" may be an improvement that will be worthy of general adoption.

THE ODOR OF FERTILIZERS.

W. L. SNYDER, CHEMIST, MICHIGAN CARBON WORKS.—The question asked on page 578: "Is the manufacture of superphosphate for fertilizer, as at present conducted, offensive to the sense of smell?" may be answered by yes and no. To some people, yes; to others no; at some times yes; at others, no. At a first encounter with the odor of fertilizers the human nose is quite apt to hustle a message up to the brain that it has struck something disagreeable this time sure; but after a time it is not so certain about it and finally recalls nearly the whole message. It is a clear case where "familiarity" does not "breed contempt." Personally I like the odor of the commercial fertilizers with which I have had to deal. The R. N.-Y.'s answer is a good one, and I am especially interested in the last sentence which refers to the odor as a disagreeable one that might be annoying to some people but is in no way injurious to health.

What Others Say

THE UTILITY OF WHAT MAKES LIFE INTERESTING.—Under this title, Garden & Forest prints in a late number some forcible thoughts and suggestions.

The growing interest in out-of-door life, and in means of recreation that can be enjoyed in the open air, is one of the most encouraging tendencies of the time. Gardening and the care of flowers and trees are becoming more and more attractive to thoughtful and cultivated people everywhere. These are sane and wholesome occupations, and they are coming to be depended upon for relief from weariness and "nervous prostration," as it is found that pleasant activity in the open air is often a more potent restorative than medicine. The primary benefit comes, of course, from our breathing purer air, and more of it, when out-of-doors; but every one needs a more inspiring reason for going out than the bare and depressing thought of the need of improvement to health. It is much better to think about our flowers or shrubbery, or to be interested in plans for the care of a garden or door-yard, than to think of ourselves in any more direct way. In all such activities immediate utility is associated with the more ideal aims.

The best garden or farm is partly a work of art. Its order and beauty add to the interest of life for its possessor, especially if he cultivates it with his own hands and brain. A day laborer with a garden, or a few square yards of ground about his door, has an artist's opportunities in the application of his taste to the capabilities of the area which he plants and shapes. He may have the delight of creating something beautiful and interesting which did not exist before. It is a serene happiness to think out plans for doing the best that can be done with even the smallest piece of ground on which anything can be made to grow. He who has room for trees has it in his power to make enduring changes in the landscape, and the care of even a few trees will supply much of interest from the time they are planted till their protector can walk or rest at will under their shade. One becomes attached to them as to children and friends, and they respond in their way. The watch against their many foes often involves unpoetical activities; but struggle is the condition of all animate being, and life without it, if it were possible, would not be interesting.

The defense of trees against their insect enemies introduces us to one of the most interesting provinces of the out-of-door world, the life of birds and their services to man. In the order of animal existence on our planet they are the natural instruments for keeping insect life down to its normal level and proportion. But we have repressed the bird population in this country to such an extent that we have produced an enormous over-development of insect life, so that the dominion is given over to them, and they have become an all-pervading curse, like that of the frogs in Egypt when they covered the land, entered the houses and climbed into the very bread-bowls. Learned men write books and governments make large appropriations to help farmers, orchard-growers and vine-growers to defend their crops against injurious insects, but if we were civilized enough to protect our friends and allies instead of cherishing our enemies, the birds would soon dispose of most of these pests.

It is often observed that birds are more particular about their food than formerly, and that many of the worst insects are not eaten by them. But that is because their supply of food is so abundant that they can afford to be dainty and to eat only what they like best. It is much the same as if a banquet for a thousand men were served every day for half a dozen. They could taste here and there, and would make little impression on the whole supply. It is so with the birds because they are so few, but if they were protected till the bird population began to press upon their means of subsistence, they would not be so fastidious, and would be glad to get any kind of bug or worm, and would snap up every one that showed his head.....

BY THE SHORT WAY.

EDITOR CHEEVER of the New England Farmer, says that he has no objections to seeing colonies of Swedes or other European workers settle in Vermont. He has a high regard for the people. He has twice met some of them in the New Sweden of Maine, but he does not wish again to see men as disappointed in this country as were some of those settlers before they had learned how to adapt themselves to the new surroundings. He is not sure that a farm that is not good enough for him is good enough for a Swede or an Irishman. If the States are to expend money for repopulating the deserted lands it will be better to expend it in making farm life attractive to people already in the country rather than in schemes for bringing in new recruits.....

MR. J. J. THOMAS mentions Maiden's Blush, Lawver, Beauty of Kent, Fameuse, Princess Louise, Jonathan, Rome Beauty and Shiawassee Beauty as among the handsomest apples known.....

DR. LAWES in his annual estimate of the wheat crop for Great Britain, as published in the London Agricultural Gazette, says that it is obvious that the question so often asked as to what manures produce wheat of high quality cannot be answered unconditionally, when land which has received no manure whatever for half a century yields wheat of a heavier weight per bushel than land highly manured every year. The truth is, there is much greater differ-

ence in the weight per bushel of the grain grown by the same manure in different seasons than between that of the grain grown by the more than 20 different conditions of manuring in the experimental field in one and the same season. In other words, quality of grain depends much more directly on the character of the season than on the description of the manures employed.....

PROFESSOR CARROLL says that at the suggestion of an eminent medical man an interesting experiment as to the value of small doses of chlorate of potash in increasing the milk of newly-calved cows has been tried at the Munster Dairy School. The experiments show that there was a slight increase in the average yield of milk during the time the cows were receiving one-quarter ounce of chlorate of potash per day. The cows kept in good health during the experiment, and there was an increase in their weight, showing that the increased yield of milk was not brought about by any drain on the system induced by the use of chlorate of potash.....

IT was said, long ago, by a careful economist, says the Husbandman, that farmers East would find larger profits if they would abandon half their acres under cultivation and bestow all their labor upon the remaining half. The estimate was not extravagant. There are many farms that give no profit whatever under cultivation, except from small areas, properly fitted and tilled, although much larger areas are plowed, seeded and yield crops barely sufficient, or less than sufficient, to pay for the work.....

IN the case of wet fields it is poor economy to do anything with the land until it is drained and made fit for use. Better leave it for grazing, or for any use that does not involve labor, for labor expended upon it while it is not in proper condition is something like direct loss.....

A HUNDRED bushels of potatoes to the acre may yield some profit, but with soil well kept up to all needs the yield may be 200 bushels, or even 300 bushels, the excess in large part, profit. So with corn, wheat, oats, barley and other crops. The trouble is in spreading over too much surface.....

UNDER present conditions thoroughness in farming is the only guarantee for success, and thoroughness is impossible to the farmer who spreads his labor over an area so great that seasons and conditions overrule his plans.....

THE NATIONAL STOCKMAN says that whether one is justifiable in borrowing money or not depends on his ability to make out of it more than it costs him. If he cannot do this borrowing is unwise. Many are compelled to borrow from time to time, though, in order to save what they have, and are in a state of perplexity as to whether it is better to sacrifice outright or to carry a load which one's income hardly seems to warrant. Debt should, of course, wherever practicable, be avoided; and the man who never finds it necessary to borrow is to be congratulated. The trouble with farmers borrowing money is that margins have been so narrow as to render it doubtful whether its use will pay its interest; and yet we know many farmers who are operating on mortgage money to advantage.....

DR. HOSKINS mentions, in the Vermont Watchman, as under his observation in his own town, a fine orchard, well cared for in unbroken sod, that had been giving but light crops of fruit, or none at all. Last autumn the owner plowed up one-half of it, applied a light coating of manure, and gave the land a good stirring up. It had not before been plowed for many years, and of course, many of the roots were torn up and broken off. The result of it is that the plowed portion of the orchard is loaded with fruit, the foliage of the trees is large, and of that deep-green shade which indicates health and thrift, while the unplowed section has but a scattering crop of wormy fruit, and the foliage is dwarfed and sickly pale in color. The experience carries its own lesson. Don't be afraid of putting the plow at work in the orchard.....

"THE Numbo Chestnut begins to bear at once. No waiting a life-time. So does the Paragon."

Thus speaks the Farm Journal. But the two varieties ought not to be mentioned in the same breath. The Numbo is coarse of flesh and bitter. The Paragon is of fair quality. Neither will bear anything like a crop in less than four years from the nursery.....

THE pecan can be grafted on hickory stocks and when successful renders the tree more hardy and induces early fruitfulness. Orchard & Garden says that some experiments on this point are necessary both as regards the best method of grafting, and best stocks to use. Mr. Georgeson advises that we raise or procure our trees from nuts grown in the north, and although it is not an absolute guarantee of hardiness, the percentage that winter-kill will be very small .....

NUTS should be planted in the open ground as soon as possible after they have ripened. If obliged to keep them over until spring pack away the seed in moist sand or soil; they should not be allowed to dry out, moisture is the secret of keeping nuts for seed. The proper depth at which to plant nuts is about one and a-half to two inches for hickories, walnuts and pecans, and about one inch for chestnuts. Sow the seed in nursery rows and firm the soil over them .....

AFTER seven years' test, Dr. Hoskins pronounces, in Orchard and Garden, the Red Bietigheimer iron-clad in New England. It has never been harmed though two winters of the seven were among the severest on record.....

HE says that the Milding Apple is winning its way in Maine as a variety suitable to localities unsuited to the Baldwin. It bears heavily and gives great satisfaction to growers as a profitable fruit for market.

DR. HOSKINS considers the Granite Beauty a winter apple of superior merit. It is hardier and more vigorous than the Baldwin. It is an annual bearer of large, roundish-oblong fruit. It is well striped and almost covered with two shades of red. Flesh, whitish, tender, juicy and pleasantly acid.....

IMPERISHABLE LABELS.—The need of a cheap, indestructible label, one on which the name of a tree or plant may be written easily and legibly with an ordinary lead pencil, will be readily admitted by all who grow fruit and flowers. We have before us a sample of label that seems to fill this want, being simple, effective and imperishable. It is made of thin copper, very soft and pliable, cut in label form with a split tag end of the same material which is wound around the tree or plant and gives with its growth. It can be written on or indented with a lead pencil or other pointed instrument and the writing is ineffaceable and indestructible and the label may be cleaned and brightened at any time by simply putting it in a hot fire. We think it is a good thing and it is quite cheap costing, we believe, about $1.50 per gross. Messrs. Johnson & Stokes of Philadelphia, Pa., are wholesale agents for its sale.

Upon seeing the above notice, the R. N.-Y. wrote to the above firm for a gross, which were duly received. Upon examination, the trouble seems to be with this ingenious device that the "tag" ends are so slight and thin that they do not retain their hold of a stake or branch around which they may have been twisted. If the plate-portion could end in a couple of strong copper wires they might well serve the purpose for which they are intended.....

WORD FOR WORD

——WESTERN RURAL: "A wife or sister or mother is a pretty good counselor, friend."

——NEW ENGLAND FARMER: "When the farm does not pay it is of public advantage that it be abandoned. The remedy for abandoned farms is in so educating the farming class that they can make a farm pay."

——GARDEN AND FOREST: "Two years ago a Mr. Barber tried the experiment of planting Pampas Grass on five acres of land in San Bernardino County, California. A few weeks ago he cut from the five acres 70,000 plumes, which he sold for three and a-half cents each, or $2,450 for the crop. The expense of caring for the five acres has not been in excess of $450, and the crop has netted him $400 an acre. Next season he expects to net $500 an acre, as the plants will then be three years old and in full bearing. The demand for the plumes of the Pampas Grass is constantly increasing and it has been demonstrated that it can be profitably grown on high-priced land."

——"BEET seed is easily grown, and every gardener who is desirous of fine beets should raise his own seed, carefully selecting medium-sized roots, having the characteristics most desired. These should be preserved in sand, carefully set out as early in the spring as possible, and the seed stems supported as they grow by small stakes and strings. A dozen beets will produce a pound or more of ripe seed."

——ORANGE COUNTY FARMER: "There are too many middlemen—one-half of them would easily do all the legitimate business—the others should go to work at some productive labor."

——ALBANY CULTIVATOR: "To keep apples in winter, spread buckwheat chaff on the barn floor, and on this place the apples, and then cover them with chaff two feet thick. Fill the interstices with chaff. Other fine chaff will answer. The chaff will exclude cold currents, and absorb incipient decay."

——"MANURING STRAWBERRIES.—Two neighbors set out strawberry beds at the same time. One had 14 rods, did not enrich his bed, and had three bushels of fruit, or at the rate of 34 bushels per acre. The other planted only four rods, and heavily mulched the bed with manure in autumn and spring. He had seven bushels of berries, or at the rate of 280 bushels an acre."

——SAM JONES: "I'd rather be a hundred old maids rolled into one, than to be a drunkard's wife."

——HENRY STEWART: "If a pig is fed upon bran and corn in equal parts, it will procure healthful subsistence from the former and sufficient fattening food from the latter, without any serious disturbance of the digestive or respiratory organs."

——S. S. TIMES: "As a rule, the things that are best for us are not those that we most desire, and the things that we most desire are not those that would be best for us. Therefore it is that one cause for gratitude which we are likely to overlook, is the fact that we do not have given to us the things that we most desire, and that we do have given to us so many things that we do not desire."

——T. B. TERRY: "It is a duty that we owe to the women of our households, that our personal appearance upon all occasions should be such as they may not be ashamed of."

Miscellaneous Advertising.

Hood's Sarsaparilla 100 Doses One Dollar

Scrofula in its severest forms, salt rheum, and all other blood diseases, are cured by the great blood purifier, Hood's Sarsaparilla. The voluntary statements of cures by this medicine are really wonderful. Send for particulars to C. I. Hood & Co., proprietors Hood's Sarsaparilla, Lowell, Mass.

If you Love, own or grow fine Fruits, beautiful Flowers, fresh Vegetables, sheltering Trees, green Lawns—if you love the Country and Nature—if you want your land to Pay, or if you want Health, Happiness and Profit in country life and work you will see The American Garden and then read it. It is the only magazine of its class in the world. Price $2 a year; 20 cts a copy. A free specimen to any one naming this paper in writing to the publishers of the magazine, the Garden Publishing Co. Ltd. 10 Spruce St, New York.

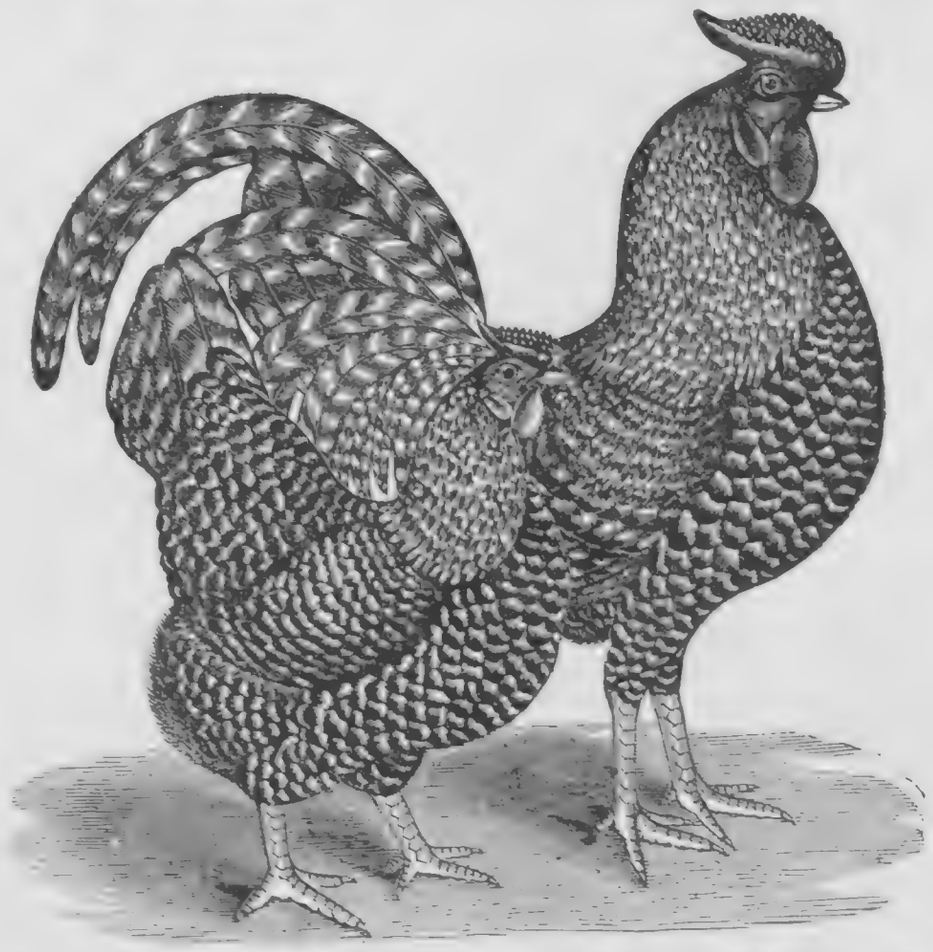
We Club it with this paper at reduced rates as below.

IN CLUB WITH THE RURAL NEW-YORKER, $3.

SALESMEN WANTED

Salary and expenses paid. Success is certain. Write J. Austin Shaw, Nurseryman, Brooklyn, N. Y.

NOTHING ON EARTH WILL MAKE HENS LAY LIKE SHERIDAN'S CONDITION POWDER



IF YOU CAN'T GET IT NEAR HOME, SEND TO US.

It is Absolutely Pure. Highly Concentrated. Most Economical, because such small doses. Strictly a Medicine. Not a Food. You can buy or raise food as cheap as we can. Prevents and Cures all diseases of Poultry. Worth more than gold when hens are Moulting. "One large can saved me $40, send six more to prevent roup this winter," says a customer. For sale by druggists, grocers, general store and feed dealers. No other made like it.

We will send post-paid by mail as follows:—A new, elegantly illustrated copy of the "FARMERS' POULTRY RAISING GUIDE" (price 25 cents; tells how to make money with a few hens), and two small packages of Powder for 60 cents; or, one large 2 1-4 pound can for $1.20 (regular price) and Guide free. Sample pack. 25 c., five for $1.00. Six large cans, express prepaid, $5.00. Send stamps or cash. In quantity costs less than one-tenth cent a day per hen. Testimonials sent free. I. S. JOHNSON & CO., 22 Custom-House Street, Boston, Mass.

THE
RURAL NEW-YORKER,
(34 PARK ROW, NEW YORK),

A National Journal for Country and Suburban Homes.

Conducted by
ELBERT S. CARMAN.

SATURDAY, NOVEMBER 30, 1889.

THE series of letters "A Summer Outing in the North Carolina Mountains," by Mrs. Mary Wager-Fisher, begun in this number, will be found most entertaining and instructive.

How to cut, cure and place before the cows corn-fodder with the least possible labor and at the same time secure it of the best quality, is a question which Mr. Rice discusses in a suggestive way on page 789.

"IT is with shame for my native State that I am compelled to say that it is next to impossible to buy at any price, in our local markets, a piece of cheese of even fair, not to say first quality." So, says Prof. Wing on page 788, in an article that will be read with interest.

A KANSAS subscriber says he wants to suggest a picture for the first page of the R. N.-Y. as follows:

"The first picture is a family standing around the mother, while she is filling a 20-pound bucket of butter. If the churning fills the bucket it goes to town to buy shoes and stockings for the little ones; if not, they will have to go to school another day with their old ones. The other picture is a group of millionaires forming a trust to advance the prices of the necessaries of the people, by simply "resolving."

THE R. N. Y. wishes all its friends a happy Thanksgiving. We all have plenty of things to be thankful for. There is something entirely wrong with the human being who cannot find some bright side of life. He is not worth considering at this time of the year. Come, friends, some of us have not had the best year in the world, some of us had too much wet and others too much dry weather, some too much heat and others too much cold. It's all right so long as we have kept our faith in the future. Let's be thankful for that, anyway. The R. N.-Y. wishes all a good dinner and a merry day!

FARMERS who want to try an experiment for next year, may be interested in the following letter, written by a subscriber in New Jersey:

"It seems to be generally conceded by the growers of potatoes that another season the crop should be planted on new or different land, on the ground that the germ of the rot or blight remains in the soil. I am going to try an experiment in this way. I have just plowed a lot in which potatoes were grown this year, in order to give the frost a chance at the germs during the winter. I shall plow again in the spring and see how I come out with the crop. I would like to know what others think about this plan?"

The R. N.-Y. would like to have a number of its readers try this experiment and see if the frost will destroy the spores of the rot.

"APROPOS of the R. N.-Y's. offer of $10 for notes on a back number, allow me to suggest that it should name a particular number, say the Thanksgiving Number, or any one to be issued soon, and offer $10 for notes on it. Notes on a number of last January or June would be, as the old saying is, 'cauld kail het again,' and would be of little interest in comparison to a criticism of new matter." P. M.

Most of the people who have entered for this prize say that as all issues of the R. N.-Y. are good, there is little choice between them. The Premium List Number seems to have a good many friends, but the range is wide enough to present a good deal of variety. We prefer that the contestant should select his own issue, as it seems evident that he could do better at his own choice than he could if we were to select for him. The "Notes" thus far received are excellent. By the way, entries for this prize will close December 15.

UNITED STATES MINISTER WILLIAM WALTER PHELPS, in Berlin, has been making a vigorous fight in behalf of the admission of the American hog into the Fatherland. Even in Germany it is, of course, quite well understood that the plea that American pork is excluded merely on sanitary grounds, is only a pretext for preventing competition between hog-raisers in this country and that. William Walter is understood to stand high in the good graces of Bismarck, but in spite of this advantage and of his undoubted ability and eloquence, he has hitherto failed to make any favorable impression on the "man of blood and iron." The other day the latter's mouth-piece, the Budget Committee of the Reichstag, backed up by the farmers of the country, refused to abrogate or modify in any way the laws and decrees against importations of American hog products. American farmers, it appears, are not the only agriculturists in the world who want tariff protection for home-raised products.

RAMIE AGAIN.

THE Ramie Company of America has been formed, with headquarters at Philadelphia, for the purpose of establishing and developing the ramie industry in this country. The company proposes to furnish would-be cultivators with plants, loan them machines for separating the fiber from the bark, and to purchase the product. Now, it is not the R. N.-Y.'s province or intention to throw cold water upon any scheme which promises any reasonable prospect for increased remuneration to the American farmer, but we would advise caution in engaging in this business. Ramie is a tropical plant, and does not flourish except in a rich and moist soil, and where there are no hard frosts. It is a very valuable fiber plant and large quantities are used as a substitute for, and for mixing with silk. It is related to the nettle which is so familiar to many farmers. Something more than a score of years ago, great things were anticipated from the culture of ramie instead of cotton in the Southern States; those who had plants to sell did a thriving business, but there was no successful method of preparing the fiber for market, and the bubble soon burst. It is said that seeds of the wood nettle have been sold as those of "American ramie." It is well to experiment with these novelties, but caution is worth a great deal to the fortunate possessor. By the way, what are the experiment stations for if not to test such things?

WHY NOT?

IN the dairy districts which supply New York with milk, good milch cows are in great demand. The majority of farmers do not raise their own stock, but buy of drovers or stock agents. Present low prices of milk have induced some dairymen to change their plans somewhat and raise the calves from their best cows; but there is still a good market in these districts for good milch animals. And now we have a set of agricultural thinkers who say that this state of affairs can be made profitable to the owners or renters of the "abandoned farms" in Vermont and New Hampshire. Good milch cows can be raised on these farms just as well as in any other district. They can be driven over into the dairy districts and sold at good prices. It would even pay the buyers to pick up the best calves they could find and take them home to raise and sell later to their original owners. Are these ideas sound? Why not? All through the portions of New Jersey where broilers are raised in large numbers, the demand for suitable hatching eggs is such that farmers who are willing to comply with the regulations enforced by the hatchers can command five cents each for their eggs. It does not pay the broiler men to keep hens to produce the eggs they need. It will not pay farmers to go into the broiler business on a large scale. So one party aids the other and both are benefited. Why are there not similar reasons for believing that farmers outside of any dairy district may profitably raise cows to sell to their neighbors?

FEED MORE OATS THIS YEAR.

OATS are lower than they have been for a number of years. In the East where the great problem is how to provide the grain ration with the best economy, observing farmers should take advantage of the drop in price. As one of our feeding authorities has recently pointed out, most farmers seem to agree that oats are suitable for "horse feed" and for but little else. It is true that within a few years some enterprising farmers have enthusiastically praised oats as food for calves and young stock, but the great majority of people still seem to consider that the oat was specially designed for the horse; and this, notwithstanding the fact that thousands of these same persons eat oatmeal themselves and find it more nutritious than any other similar food. There is no reason why oats should not be fed with profit to all kinds of stock, cattle, sheep, pigs and poultry. We do not mean fed exclusively, but fed in combination with other grains and fodders. A bushel of oats this year will contain as much nutriment as a bushel contained last year. Suppose the price to be five cents less. By mixing the oats with other and more expensive substances you get your ration for milk, pork or beef at just that much less. The art of making up a good grain ration from several sorts of grain brings the best profit when some one grain is low in price. The R. N.-Y. will have more to say about grain combinations that will enable farmers to take advantage of the low price of oats. Probably a good many of our readers do not need any reminder. To all such we may say that we would like their opinion and experience as to the best way to feed oats to advantage.

CONSENSUS OF AGRICULTURAL OPINION.

THE Farmers' Congress, a heterogeneous assemblage of 325 delegates from various parts of the country, but chiefly from the South and West, which adjourned at Montgomery, Alabama, a week ago, could come to no decision with regard to the most appropriate national flower; but had no hesitation in expressing very decided opinions on various questions of grave national importance, in its "resolutions." Very properly indeed, it resolved that the Grange and all other agricultural organizations should combine to secure State and National legislation for the benefit of farmers. It resoved that Congress should establish one or more deep-water harbors on the Gulf coast for the purpose of promoting trade between this country and Central and South America; but it refused to indorse a proposal for a national subsidy to a steamboat line to carry on that trade. It demanded that the Department of Agriculture should once more ascertain the causes of swine plague and again recommend remedies for the scourge. It favored the organization of a National Board of Agriculture for the consideration and promotion of agricultural interests and the appointment of two delegates from each State to co-operate with the Board. It insisted that the legislatures of the different States should make appropriations for defraying the expenses of delegates to national farmers' congresses. It heartily indorsed farmers' institutes and recommended their introduction in all the States, and "resolved" that the National Government should aid in the matter. It advocated closer relations between producers and consumers. It demanded a comprehensive scheme for the improvement of the Mississippi River at the national expense, and the construction of a ship canal connecting Lake Michigan and the Father of Waters. It refused to urge unlimited silver coinage, or the repeal of internal revenue taxation; nor would it indorse the proposal that the taxes on whisky and tobacco should be regulated by different States to relieve local taxation. A resolution favoring the granting of bounties to sugar producers, was voted down. Finally, by a vote of 261 against 63, it "resolved" that Chicago should be the site of the World's Fair in 1892. It is always a matter of interest and often a matter of importance to ascertain the consensus of opinion of a body of 300 ordinary farmers even in a local assembly; how much more forcibly can this be said of a convention composed of 300 representative farmers from widely separated parts of the country met to discuss questions not merely of local but of national import! Such conventions are among the most potent factors in the creation of the public opinion of a country and should receive more attention from the agricultural press.

THE GRANGE PLATFORM.

THE National Grange in convention during the week at Sacramento, California, last Tuesday adopted a report favoring the increase of small farms and restriction on foreign immigration. It also resolved "to memorialize Congress in favor of the manufacture of jute and other textile fabrics for use instead of cotton bagging." If our telegraphed synopsis of the resolutions is correct, it appears that the Grange is not quite in harmony with agricultural associations in the South in this matter; for, without an exception, they all favor the use of cotton bagging in preference to jute. Even if the latter were admitted duty-free, its purchase would always take millions of money out of the country, that might well be kept at home, and the raw and manufactured products would always be liable to be "cornered" by speculators and money-eyed sharpers at home or abroad. On the other hand, the manufacture of cotton bagging would afford a profitable market for the coarse grades of the staple and this would have a tendency to stiffen the prices of the better kinds; while cotton is too abundant among us to render "cornering" practicable, except occasionally in the case of some particular "option," for a brief period. The Grange also favored the supply of school books at cost, and condemned the single-tax system. It advocated the increase of silver coinage, and the circulation of paper money, independent of the national banks, in sufficient quantities to prevent financial embarrassment. A live agricultural paper, fully awake to all movements in this and other countries, likely to affect the welfare or engage the interests of its patrons or of a considerable number of them, should be prompt in laying before them pithy condensations of the proceedings at the important conventions of recognized agricultural representative bodies, even if it cannot always indorse all the planks in their platforms.

BREVITIES.

THE STORY OF THE WEEK ON THE FARM: RAIN.

READ a Young Farmer's Ideas and Practice on page 789. It bears upon the question, Does Farming Pay?

MR. COLCORD writes as follows regarding his patent silage:

"I shall open my silo this week, probably. The silage in it has never had any acid whatever in it. I can find no changes in it. The juice is perfectly sweet."

SINCE Mr. Colcord published his book on the preservation of "green forage," a new discussion as to the desirability of weights for the silo has been started. John Gould states the case for a class of siloists on page 790. Next week the R. N.-Y. will give notes from some of the best silo builders in the country, showing their methods of covering silage and weighting it.

UNLESS the weather conditions change, the prospect for the Thanksgiving poultry market is decidedly discouraging. The supply is heavy. Fresh, prime stock, arriving in good condition, sells readily at fair prices, but anything of lower grade must be sold for whatever buyers may offer, while some is likely to be dumped in the river. Venison is outlawed, so no more must be shipped.

IT seems likely that a combination will soon be formed between the Farmers' Alliance and the Knights of Labor. A week ago Colonel L. F. Livingston, President of the Alliance in Georgia, together with a number of other prominent representatives of the order, visited the convention of the Knights in session at Atlanta and heartily approved of the projected union. The annual convention of the Alliance will begin at St. Louis on December 3, and it appears highly probable that the dream of Powderly's life—a confederation of the farmer and the mechanic—will be realized.

Woman's Work.

CONDUCTED BY EMILY LOUISE TAPLIN.

CHAT BY THE WAY.

THANKSGIVING season comes around again with its usual regularity, whether we feel inclined for thankfulness or not. It is not a very bright time for a good many, we fear. This has been a trying year, but at least we can take Jo March's advice, and think of our mercies. We are very apt to think exclusively of our trials, and it is just as well to have a festival which should remind us of the other side.

* * *

AMONG handy trifles which will come in very well for Christmas gifts are all styles of pincushions. Very pretty ones are fitted into the little round Japanese cat baskets, costing from two to five cents each. The cushion is made round and firm, first in a piece of stout muslin tied tightly round to keep it compact and then with a pretty piece of silk or plush. The inner edge of the basket is then glued all round, and the cushion fitted tightly in. It should be made to fit well and rather larger than the basket, or it is apt to slip down. When dry, a narrow fancy ribbon is tied around the edge, and finished with a bow.

Another novel pincushion is made with a child's little wooden spade for its foundation. The cushion may be round, square, or oval, and is fastened to the spade by a touch of glue. Four little holes have previously been bored through the spade; through these a narrow ribbon is passed tied in two bows at the back. These ribbons pass over the cushion, securing it in addition to the glue. The cushion may be of any pretty color; a narrow frill all round is quite an addition. A little bow may be put at both top and bottom of the handle, with a loose length of ribbon between, to hang it up by. The spade may be gilded or enameled. The same style may be carried out with a large wooden spoon instead of a spade. Another pretty pincushion may be made in the same way, and fastened on a small wooden palette, hung up by a bow passed through the thumb-hole.

* * *

As an aid to home dress-makers we may offer the following proportions for a skirt, which should hang well. It consists of four pieces, a straight back, 37 inches wide; a front breadth 29 inches wide at the hem, and nine at the waist; one gored piece at either side, each 24 inches at the hem, and 16 inches at the waist. It should have a thin crescent-shaped pad instead of a bustle, and a steel 12 inches long should be inserted about 11 inches from the waist. This will be found a good foundation for all the straight gowns now in vogue.

* * *

THE fortunate housekeeper who starts with a really good collection of house linen will find the care of it afterwards quite as important as the first purchasing. It will last a very long time if it is only properly cared for, but it must be examined carefully, mended, if need be, and thoroughly aired, after every wash. We have been perfectly astonished, on several occasions, by seeing housekeepers fold up their clothes and linen, and lay them away, immediately after ironing, without any airing whatever.

The first essential for neatness and good care is a convenient closet. The shelves may be covered with old sheets or coarse muslin tacked at the back, and left hanging a sufficient width to turn up over the shelf when the linen is arranged, to keep away dust. Hanging inside the door a list should be kept, giving all the articles kept on each shelf. Lavender, the orthodox perfume for clean linen, is said by some to attract moths, so the housekeeper might distribute little bags of cedar chips here and there through the closet, for the sake of the odor.

Things in constant use should be put on the lower shelves; articles less called for above. Each pile of things must be well away from its neighbor; each set of things well sorted. Different patterns of towels or napkins should never be mixed. Indeed it is really better for a house-keeper of modest means to get all her napkins, or towels, or table-cloths, of one pattern, as far as possible; some will always wear out before the rest, and there is thus less danger of broken sets.

Always use the things in rotation, putting the last article washed at the bottom of the pile. Be sure that *everything* is marked, whether washed at home or not. Most ordinary marking is done now-a-days with indelible ink, but where time and inclination allow, marking in cross-stitch is desirable. When ink is used, one of the patent glass pens, sold for the purpose, will be found preferable to any other.

GOLDEN GRAINS.

How different is the life within our breast
From what we seem to those who know us best.

BETTER take the vow of abject poverty, and live up to it forever, than to allow the love of money to sap the spiritual life.....

PRAYER does not directly take away a trial or its pain, but it preserves the strength of the whole spiritual fiber, so that the trial does not pass into temptation to sin.....

RELY upon it, this is the very substance of life, the credit sum when the balance is struck—practical usefulness. He lives to a good purpose who lives to do good and when his stewardship is ended, his works follow him.....

THE moral courage that will face obloquy in a good cause, is a much rarer gift than the bodily valor that will confront death in a bad one.....

WE have certain work to do for our bread and that is to be done strenuously; other work to be done for our delight, and that is to be done heartily; neither is to be done by halves or shifts, but with a will, and what is not worth this effort is not to be done at all.....

TO FEAR the foe, since fear oppresseth strength, lends in your weakness, strength unto your foe, and so your follies fight against yourself.....

Domestic Economy

CONDUCTED BY MRS. AGNES E. M. CARMAN.

"Open the doors and windows,
And let in the golden air,
Sweep out the dust and cobwebs,
And make the old home fair.
For swift from hamlet and city,
Swift over river and sea,
My boys and girls are hasting
To keep Thanksgiving with me."

THANKSGIVING.

IN our high-strung, hurried American life we have great need of all the helpful recreation we can obtain, and especially should we seek to foster and encourage the observance of any custom which tends to awaken the dormant emotions of gratitude in our hearts, or to knit more closely together the family interests and ties. To that grand old Hebrew nation who long ago instituted and rigorously kept their annual Feast of the Tabernacles—or as it is

otherwise beautifully called "feast of ingathering at the end of the year,"—being held in the autumn after the whole of the chief fruits of the ground—the grain, the wine and the oil—were gathered in, we doubtless owe the suggestion of observing a set time for thanksgiving.

Long before the Pilgrim Fathers had come to this country, there was an occasional observance of such a day in various parts of Europe formally recommended by the civil authorities, usually for some signal victory or remarkable deliverance from danger. But it was left to our own sturdy, conscientious forefathers to inaugurate its observance out of gratitude for the common mercies of life, and to make it one of our most beautiful and permanent holidays. Surely it is a most fitting and typical outgrowth of their conscientious gratitude under hard and trying conditions.

In the winter of 1620 a little band of 102 immigrants were landed on the bleak and forbidding coast of Cape Cod Bay. They were not people who had all their lives been inured to physical hardships, for many of them were gentle, delicately-reared men and women. No wonder therefore that the privation and hardships necessarily incident to life in a new country with a severe and rigorous climate, sadly decimated their ranks until ere the first year had passed a startling number of new-made graves made doubly precious and sacred their new home. Yet, in spite of all the suffering and hardships they had endured, the next winter found them with so much for which to be grateful that they had to appoint "an especial day on which to give especial thanks for their mercies."

It is impossible for us in our modern comfortable homes to conceive of the discomforts and suffering they must have endured, and when their whole harvest was gathered, I suppose it was no more than that of the average thrifty farmer of the present day. "Governor Bradford sent four men out fowling that they might obtain luxuries for a feast of rejoicing together." About this time a friendly Indian Chief, Massasoit, with some 90 men, came among them, and they went out and killed five deer, and contributed to the entertainment, which they shared for three days. Thus with a feast of venison and fowl was the first Thanksgiving Day in New England celebrated; for with their scanty, rude appliances for cooking and the small store of provisions in their larder, you may be sure there were few of the dainties which we think essential to a modern feast. This occurred in the year 1621.

Afterwards special seasons of prosperity were often made the occasion of public thanksgiving, and on several occasions a day of fasting and prayer was changed into one of thanksgiving by what seemed an immediate answer to their prayers. Such an instance occurred in July 1623. There was a very severe drought which threatened the destruction of their entire crops. The Governor appointed a day of fasting and prayer: but, lo! while they were praying copious rains fell, and it was made a day of most hearty and sincere thanksgiving, kept with religious observances as was always the custom. History tells us of various other thanksgiving days; but it was not until half a century and over had passed that we find any indications of its having become an annual custom.

During the revolution, Thanksgiving Day was a national institution, annually recommended by Congress. But after 1784, when there was held a general thanksgiving for peace, we had no other national appointment until five years later, in 1789, when President Washington by the request of Congress, recommended "a day of thanksgiving for the adoption of the Constitution." Though at various times there were proclamations of thanksgiving for especial deliverances and mercies, yet it was mainly in the New England States that an annual proclamation was issued by the Governors of the various States, and it is to them that we owe the perpetuation of the day, for they made it their principal social and home festival usually kept with appropriate religious ceremonies.

During our civil war President Lincoln issued proclamations appointing special thanksgiving for victory both in 1862 and 1863, and he issued a national proclamation of annual thanksgiving in 1863 and 1864, since which time such a proclamation has been issued annually by the President as well as by the Governors of the States and mayors of the principal cities.

In many respects this has been a most disastrous year; many terrible calamities have visited us; death has reaped an unusual harvest. The destruction of property has been immense. For some kinds of business too—noticeably for that of farming, which affects wider interests and more people than any other one industry—this has been an unfortunate year. In some sections of our vast country husbandmen have contended with a severe and destructive drought; while in others they have suffered from long-continued rains and even floods. The result of all this will be to cause many people to doubt whether they have any cause of gratitude—any reason for giving thanks. But I doubt if there be one reader of this paper who has not many. He may have to look below the surface of things material—at the real values of life—to find them; but he will be a better man if he looks and gives thanks. Let each show that he has inherited a little of that sense of justice and appreciation which the Pilgrim Fathers had.

For some strange and occult reason a majority of people seem inclined to look on the dark, rather than on the bright and hopeful side of life. They deliberately choose to hug the trials and sorrows of life to their hearts rather than to "count their mercies" and give thanks. We are not apt scholars, any of us, at learning what a valuable "elixir of life" a glad, hopeful heart is. We should pity or congratulate people rather for their temperament than for the conditions of life in which they are placed. To be sure, we did not choose our temperaments; but it is obligatory on us all to cultivate a habit of cheerfulness and hopefulness until we have made it a part of our very selves.

Financial embarrassments are hard to endure; sometimes there are circumstances which make them distressingly so; but, at the worst, they are usually soon lived through, and if honestly, bravely, and philosophically borne, rarely leave a sting behind them. Some day you may even look back and see that they were a link in God's helpful mercies. It is not wealth or even an abundance that makes unselfish, grateful hearts, for oftener it is found to be the very reverse of this, and some of the keenest reproofs I have ever felt in life came from seeing how contented, happy, and peaceful were the lives of people whom in my ignorance I had pitied.

On the busy, over-worked housewife falls the duty or the pleasure of taking the initiatory steps towards celebrating this or any other domestic anniversary. Many circumstances may deter her from making an old-fashioned New England banquet which seems a culmination of all the luxuries of the year, and to which all the uncles, aunts, and cousins are invited. This is, indeed, beautiful; but if you can only compass a simple little feast for your own immediate family, by all means do that little with enthusiastic, glad and thankful hearts. If your children are old enough to be of the least assistance arouse their sympathies, and convince them that you greatly need their co-operation. Many a mother who hungers for appreciation and praise in her round of prosaic, grinding duties, forgets to brighten her child's life by making it feel itself indispensable to her happiness. If more of the spirit of Thanksgiving Day permeated all the days of the year, we should hear far less of unhappy homes and thankless children. If we emphasized more the sweetness, the gladness and happiness which our children bring into our lives, we would enlarge their hearts, expand their sympathies and make them to become truer, braver, more unselfish men and women. There is no trouble in keeping children at home on Thanksgiving Day, because home is such an attractive place to them, they feel no temptation to leave it. Thus should it be every day of the 365.

If you live in the country and have gathered as many beautiful souvenirs of the fields, lanes, and woods as there are abundant opportunities for doing, you have ample material with which to decorate your table and home tastefully and beautifully. Relegate this part of the work to the children; let them exercise their own taste and judgment unless they ask for advice, and see what bowers of beauty they will transform your room into, and—what is better yet—see how long the spirit of helpfulness will abide with them. I have often thought that the injunction "Be virtuous and you'll be happy:" should be reversed, making it read: "Be happy and you'll be virtuous." There is no safeguard in life for either men, women or children comparable to the chords of sympathy and love which bind one to a cheerful, happy, Christian home. Such a home all go from with reluctance and return to with joy. There all days, even fast days, are thanksgiving days, and fitly typify the beautiful home immortal. KATHARINE B. J.

"WHAT an agreeable man Mr. Henderson is" said my wife, turning to me; "most companionable; and yet—and yet, my dear, I'm glad he is not my husband. You suit me very well." There was an air of conviction about this remark, as if it were the result of deep reflection and comparison, and it was emphasized by the little possessory act of readjusting my necktie—one of the most subtle of female flatteries.

"But who wanted him to be your husband?" I asked. "Married women have the oddest habit of going about the world picking out men they would not like to have married. Do they need continually to justify themselves?"

"No; they congratulate themselves. You never can understand."

"I confess I cannot. My first thought about an attractive woman whose acquaintance I make is not that I am glad I did not marry her."

"I dare say not. You are all inconsistent, you men."

From "A Little Journey in the World" by Charles Dudley Warner in Harper's.

LITTLE GIFTS.

MANY who want to give largely at Christmas time are compelled to be content to give only trifles and they are more perplexing to select than any other class of gifts, for they must be good of their kind and acceptable to the receiver. One who has time and even a little money can do wonders we all know, but there are many who haven't the time for more than a few stitches here and there and then the $5 seem very paltry that must be divided among the 20 relatives and friends, who positively must be remembered if the goodwill felt toward them is to have any expression at all. Well, that means only 25 cents to spend for each one and the thought makes life look miserable for a little while; then the determination to make every quarter do its very best lifts a little of the cloud and the planning begins. The child-friends it seems possible can be pleased by spending 25 cents for each of them, but what can be bought for the older ones? A list is made out with the following result and gifts for all are settled on at last.

Standard works in the Seaside Library in paper binding are each 20 cents. Covering them with the most artistic sateen or other cloth covers makes them worth more than their cost. Three-quarters of a yard 26 inches wide, will be ample to cover four books, so that the outlay for the covers need not add more than five cents to the cost of each book, and the binding will add very greatly to its strength and durability. Handkerchiefs at one, two or three for a quarter, according to the needs of the one to receive them, or five of the gayly bordered five-cent ones for the little sister or brother who is delighted with quantity and supremely indifferent to quality, will give satisfaction. A collar and pair of cuffs, or two nice collars can be bought for the sum we are spending, or a yard of soft ruching. There are photographs of noted people and places that can be bought for 25 cents apiece either mounted or unmounted. A collection of black pins, needles for sewing and for darning, a five-cent tape measure and a button bag can go to make one gift.

A plant or two from the greenhouse will be an acceptable offering for one friend's window garden. Five packages of flower seeds, the old favorites that sell at five cents a paper and give a wealth of pleasure, or one or two packages of rarer seeds, especially such as should be started very early in the spring, as pansy and verbena; a collection of verbena seeds, scarlet, separate and fine mixed in another package are a good choice. There are numberless useful things for the kitchen that may be acceptable gifts—a wire potato masher, a toaster, a stiff cleaning brush that costs eight or ten cents, a little strainer to be attached to the spout of the coffee-pot, a tin flour scoop, a whisk broom to be used about the stove and other articles the buyer will find when he starts out to select them to the value of our coin.

If these homely trifles happen to appear on Christmas morning in costumes of vivid calicoes or even silks with improvised heads and arms, it will be a mystery, of course, and should each one bring a speech in its hands setting forth its own special uses, and promising (of course, not extravagantly) many things for the future, that will be a mystery too.

A few such funny things in the Christmas pile are just as necessary in some homes, and just as natural expressions of the jollity felt there as the laughter that goes with the dinner and lasts after the supper. Grinning potato dolls for the most serious members of the family, gingerbread men for the oldest; a stick of candy for the one who hasn't a sweet tooth; an elaborate tissue paper bonnet for one of the boys or a pair of leather spectacles for another.

Christmas would not be itself in many homes with all the friendly jokes left out, and how these are remembered by the children when they have grown up and left home. If there is only a little to spend for the holiday gifts, let us spend it with a hearty good-will, and by forethought find some trifle that will gratify a wish or fill a need, and then give with it a rhyme, a riddle, a joke or a legend or a timely greeting, and be content, even though others spend dollars where we can spend only cents.

ALICE EWALDA BROWN.

GLEANED FROM HERE AND THERE.

AS oysters are in season now, anything about them is also in season. In looking over an old Popular Science Monthly, I find the following, which shows that, despite the old saw "As dumb as an oyster," oysters are not so dumb after all—that they can be taught to keep their mouths shut—a degree of "teachableness" not possessed by many people who would be indignant should it be only hinted that they were dumb.

"The oyster is not such a fool but that it can learn by experience, for Dicquemase asserts that if it is taken from a depth never uncovered by the sea it opens its shell, loses the water within and perishes. But oysters taken from the same depth, if kept in reservoirs where they are occasionally left uncovered for a short time, learn to keep their shells closed, and then live for a much longer time when taken out of the water. This fact is also stated by Bingley, and is now turned to practical account in the so-called 'oyster schools' in France. The distance from the coast to Paris being too great for the newly dredged oysters to travel without opening their mouths or shells, they are first taught in the schools to bear a longer and longer exposure to the air without gaping, and when their education in this respect is completed, they are sent on their journey to the metropolis where they arrive with closed shells and in a healthy condition."

I do not know whether or not any of my readers have noticed how differently the word *dumb* is used. Webster says that dumb means destitute of the power of speech—not willing to speak; silent—but in some parts of the country it is used with an entirely different meaning. It takes the place of or is synonymous with stupid. We often hear people say: "She's an awfully dumb child," when they mean a stupid child. The oyster is *dumb* when the word means silent, but from the above, not so, when it means stupid. If there is any authority for dumb being used as meaning stupid, I should like to know it. Can any one tell me?

* * *

THE ORIGIN OF WORCESTERSHIRE SAUCE.—The following is from the London World of some few years ago. "A scrutiny of the label will show that it is prepared 'from the recipe of a nobleman in the country:' The nobleman is Lord Sandys, and Messrs. Lea & Perrins's connection with the sauce came about rather curiously. Many years ago Mrs. Gray, author of "The Gambler's Wife" and other novels, well known in their day, was on a visit at Ombrisley Court, when Lady Sandys chanced to remark that she wished she could get some very good curry-powder, which elicited from Mrs. Gray that she had in her desk an excellent recipe, which her uncle, Sir Charles, Chief Justice of India, had brought thence and given her. Lady Sandys said that there were some pretty clever chemists in Worcester who, perhaps, might be able to make up

Miscellaneous Advertising.

When Baby was sick, we gave her Castoria,
When she was a Child, she cried for Castoria.
When she became Miss, she clung to Castoria.
When she had Children, she gave them Castoria

the powder; at all events, when they drove in after luncheon they would see.

Messrs. Lea & Perrins looked at the recipe, doubted if they could procure all the ingredients; but said they would do their best, and in due time forwarded a packet of the powder. Subsequently the happy thought struck some one in the business that the powder might, in solution, make a good sauce. The experiment was made, and by degrees the thing took amazingly. All the world, to its remotest ends, now knows of Worcestershire sauce as an article of commerce; and notwithstanding that in common with most good things it is terribly pirated, an enormous trade is done in it. The profits, I am told, amount to thousands of pounds a year, and I cannot but suppose that liberal checks bearing the signature of Lea & Perrins, have passed from the firm to Mrs. Gray, to whom it is so indebted for its prosperity.

* * *

THE origin of blue-tinted paper came about by an accident, a mere slip of the hand. The wife of William East, an English paper-maker, accidentally let the blue bag fall into one of the vats of pulp. She held her peace fearing her husband's anger when he discovered the damage which she supposed she had done. Mr. East could not account for the color of the paper and thought it was ruined. He, however, put it on sale and it went like the proverbial "hot cakes." He received some heavy orders which he could not fill and was about to give it up, when his wife told what had happened. By this very blue paper, discovered by an accident, Mr. East made his fortune—and I suppose Mrs. East did also, only nothing is said on the subject.

DORA HARVEY VROOMAN.

"FANCY-WORK" OF A CENTURY AGO; TIMELY COOKERY.

IF those ladies who are so criticised for spending much needless time and eyesight in fancy-work nowadays could see some of the marvelous creations in lace and embroidery and painting done at the Moravian Home of the Single Sisters in Bethlehem, Pa., between the years 1777 and 1794, they might take courage—which would be a pity. But two or three pieces were so remarkable that I must "tell about them" anyway.

One was a bit of what looked like very fine "book-muslin" a foot in length by six inches in width; on this, partly in drawn work, and partly in embroidery, and lace stitches, were 76 palm leaves and medallions, each done in a different stitch. The medallions were arranged as a center-piece, each bearing the initials of the maker; for this was done by several different hands, and the palm leaves made a border; and so minute was this work that quite a space was left around the center-piece and a good margin beyond the border. The whole was framed under glass for preservation. Another piece of work was a satin watch paper—ask your grandmothers about that fashion—containing within its tiny circle a wreath of 50 painted blush roses, each as perfectly shaded as are the life-size ones painted to-day and the attendant in charge averred that the work was "done by the naked eye."

Our present fashion of embroidery in ribbon and arasene is but a revival of a fashion in vogue over 100 years ago, as testified by pieces shown there, but the fancy-workers of to-day have greatly enlarged the patterns; one spray, shown there, of diminutive roses, and buds and leaves, less than four inches square, including margin, was done as perfectly as that now done of five times its size; the arasene used was not coarser than our embroidery silk. It makes one's eyes ache only to look at such flowers; the eyes that guided the needle to make them must have had even greater power than Sam Weller, in the famous case of Bardell *vs* Pickwick, said he must have to answer the cross-examining barrister's questions. This work, showing such infinite patience, was done by the so-called "Moravian nuns;" but the Moravians disclaim the existence of nuns, as the term is generally understood, either past or present in connection with their church at B. The "Home," still standing, was provided literally for single sisters whether widows, "old maids," or young girls, who had not the shelter of a husband's brother's or father's house.

Perhaps the cooks who read the R. N.-Y. will appreciate a couple of recipes used by these "sisters." One is a "German Christmas Loaf, (Strietz):" One-and-a half pint of milk, one-half pound of butter, one cup of sugar, three-fourths of a pound of raisins, one-fourth of a pound of currants, three ounces of citron, two dozen almonds blanched and pounded, three pounds of flour, one tea-spoonful of salt, and one-half cake of Fleischman yeast. Set a sponge over-night with one pint of the milk, one pound of flour and the yeast dissolved in water. In the morning add the butter and sugar rubbed in the flour, the salt and the half pint of warm milk. Knead till the dough no longer sticks to the hands, adding flour gradually; lastly add fruit rolled in a little flour. Let rise again, and when light, divide into small loaves, which roll out an inch thick, lap over, and put on flat tins to rise again. When light, bake in a well heated oven for half an hour.

Another dish is called "Ollicooks" much like our doughnuts, and takes two days to prepare it. The ingredients are one pound butter, one and a-half pound of sugar, one quart of milk, one-half pint of yeast, 10 eggs and one nutmeg. Take the milk and yeast and half the butter, and set a sponge, adding sufficient flour at noon. In the evening mix the other half of the butter with the sugar and grated nutmeg to a cream, have the eggs well beaten, and put all into the sponge, adding flour as stiff as can be stirred, and set in a warm place; in the morning roll out in the hands (not on a board) put a raisin in the middle of each, lay on a board and let rise again for a few minutes: then drop in boiling lard. BETTY.

THINGS THAT HURT.

WE were going "up town" in an elevated car not long since when a gentleman with his little daughter, probably three years of age, entered the car at Park Place and took the seat opposite us. The child was exceedingly bright-looking, very observant and talkative and her clothing showed care and taste in its picturesque effect. The father was intelligent-looking, had a kind, good face and was evidently a well-to-do business man. Tied to the fathers' trim umbrella was a narrow package 18 or 20 inches in length.

The little daughter soon pointed to the package and demanded her dolly. "No," said papa, "you can't have it. The trainman won't let you have dolly on his cars." The little tot looked somewhat incredulous and after a moment of silent wonderment and a sharp look at the brakeman who stood at the end of the car said in a half crying tone: "Me want dollie." "No," came the answer "if the man should see your dolly he would come right in and take it away from you and carry it out there," pointing to the platform.

LUNCHING at a restaurant we sat at table with a mother and child; the latter could not have been over five years of age. She asked her mother for a cup of coffee. The mother evidently expected the request for she had ordered a pot of coffee and two cups. The coffee was given the child undiluted and without the slightest hesitation.

THE LEADING WRITERS.

CELEBRATED ARTISTS.

$2 A YEAR

SIXTEEN PAGES EVERY WEEK

SPECIAL FEATURES.

Herbert Ward, Stanley's Companion.

Herbert Ward, the companion of Stanley in his explorations in Africa, is the only white man connected with Stanley's African explorations who has ever returned alive from the "Dark Continent." Mr. Ward's articles running through eight numbers of the "Ledger" are of the most intensely interesting description, and cover five years of his adventures in Africa, and they will be illustrated by sketches made by Mr. Ward, and by the reproduction of photographs taken by him in Africa. These pictures will throw much light upon the manners and customs of the hitherto unknown cannibal tribes of Africa.

The Story of a Forsaken Inn, (A SERIAL STORY) *By Anna Katharine Green.*

Life in British America, *By Rev. E. R. Young.*

Being the adventures and experiences of Rev. E. R. Young, the celebrated missionary, and his wife during their residence in the Polar region twelve hundred miles north of St. Paul, in which Dr. Young narrates how he tamed and taught the native wild Indians of the Northwest; how he equipped himself for and how he made his perilous sledging and hazardous canoe trips when visiting all the Indian settlements within five hundred miles of his home.

Honorable Henry W. Grady

Contributes a series of six articles on the "Wonderful Development of the Industrial Pursuits of the New South."

American Cookery, (A SERIES OF ARTICLES) *By Miss Parloa.*

Giving the reasons why it is imperfect, and some ways by which it may be improved.

Nihilism in Russia, *By Leo Hartmann, Nihilist.*

Leo Hartmann, a fugitive from Russian authorities, has been connected with the most daring feats of the Russian Nihilists. Mr. Hartmann shows how the intelligent people of Russia are becoming Nihilists in consequence of the despotism of the form of government. A participant in plots to kill the Czar, such as the blowing up of the Winter Palace, he is able to give true information as to how this and other great schemes were accomplished. The situation in Russia is sufficient to increase the love of every true American for our form of government.

EXTRA SOUVENIR SUPPLEMENTS.

Among these beautifully illustrated four-page souvenirs, which will be sent free to every subscriber, will be a poem by

John Greenleaf Whittier, *Illustrated by Howard Pyle.*

Written for the "Ledger" by Mr. Whittier in his 82nd year. Another souvenir will be a beautifully illustrated poem written by

Honorable James Russell Lowell.

The Ledger will contain the best Serial and Short Stories, Historical and Biographical Sketches, Travels, Wit and Humor, and everything interesting to the Household.

MASON & HAMLIN

The Cabinet Organ was introduced in its present form by Mason & Hamlin in 1861. Other makers followed in the manufacture of these instruments, but the Mason & Hamlin Organs have always maintained their supremacy as the best in the world.

Mason & Hamlin offer, as demonstration of the unequalled excellence of their organs, the fact that at all of the great World's Exhibitions, since and including that of Paris, 1867, in competition with best makers, of all countries, they have invariably taken the highest honors. Illustrated $22 to $900 catalogues free.

ORGANS

Mason & Hamlin do not hesitate to make the extraordinary claim for their Pianos, that they are superior to all others. They recognize the high excellence achieved by other leading makers in the art of piano building, but still claim superiority. This they attribute solely to the remarkable improvement introduced by them in the year 1882, and now known as the "MASON & HAMLIN PIANO STRINGER," by the use of which is secured the greatest possible purity and refinement of tone, together with greatly increased capacity GRAND & UPRIGHT, for standing in tune and other important advantages.

PIANOS

A circular, containing testimonials from three hundred purchasers, musicians, and tuners, sent, together with descriptive catalogue, to any applicant.

Pianos and Organs sold for cash or easy payments; also rented.

THE FOOS MANUF'G. CO. SPRINGFIELD, O.

THE BEST MILL ON EARTH

A WET HEN

The man who has invested from three to five dollars in a Rubber Coat, and at his first half hour's experience in a storm finds to his sorrow that it is hardly a better protection than a mosquito netting, not only feels chagrined at being so badly taken in, but also feels if he does not look exactly like

We offer the man who wants service (not style) a garment that will keep him dry in the hardest storm. It is called TOWER'S FISH BRAND "SLICKER," a name familiar to every Cow-boy all over the land. With them the only perfect Wind and Waterproof Coat is "Tower's Fish Brand Slicker."

Ask for the "FISH BRAND" SLICKER and take no other. If your storekeeper does not have the FISH BRAND, send for descriptive catalogue. A. J. TOWER, 20 Simmons St., Boston, Mass.

Literary.

MAGAZINE REVIEWS.

DRESS for November—December, contains a continuation of the articles on "Physical Culture" with the different exercises illustrated by diagrams. These exercises are intended to produce normal development of the entire physical system. Mary A. Livermore, under "Health and Woman's Dress," gives a very sensible talk on the folly of the prevailing system of dress, which she thinks is largely responsible for the prevailing weakness of women of the present day. Many if not most of the physical conditions surrounding women and girls have vastly improved since her girlhood days; but the physical stamina of the American people does not improve. She attributes this largely to the unhygienic dress and bad habits of life of the young women, and the tobacco, alcohol and other pernicious habits of the young men. "No young, growing girl should be allowed to wear corsets." The magazine abounds in directions and suggestions for dressing hygienically and at the same time fashionably. It is, in short, an exponent of fashionable dress-reform. One criticism of the Jenness-Miller system, as well as of other dress-reform systems, is that it is too expensive for the class who need it most. Their reply is that they have sought first to interest the fashionable element, realizing that it is the society leader's dress that the average young woman watches most closely. It certainly should cost no more to dress healthfully and comfortably than fashionably and uncomfortably. Beginning with January, the magazine will be issued as a monthly. Jenness-Miller Publishing Company, New York.

GODEY'S LADY'S BOOK, the delight of so many of our mothers, and grandmothers has now been published 60 years without missing an issue. No better proof could be given that it meets the wants of its large list of readers. The November number, now before us, consists of over 90 pages, besides a full-page engraving, a colored fashion-plate and a page of architecture. The fiction consists of a Thanksgiving, a Hallowe'en, and a humorous story, three other short stories, and the closing installments of two serials: "A Model American Girl;" and "A Woman's Way." A half-dozen poems, "The Beautiful Home" Club, Chats with Our Neighbors, Household Department and Work Table, Book Reviews, etc., fill out the varied contents of the number. The Work Table gives an unusually pretty pattern for the new and popular Roman, or Guipure embroidery. The fashions are from the latest Paris models, and by a system of coupons, sent with the magazine, each subscriber has one choice from all the patterns of the month. This month there are 28 to select from. Sample copy, 15 cents. The Godey Publishing Company, Philadelphia.

BOOK REVIEWS.

HOLIDAY books multiply, and as a matter of course, a large proportion of them are for the young people. Three good examples of these are before us this week: Little Miss Weezy's Sister, by Penn Shirley, is a pleasant little child's story. It is rather bright and funny, and will suit the ten-year-olds. Cloth; 5x6¾ inches; 159 pages; price 75c; Lee and Shepard, Boston.

BETTY LEICESTER is a fresh and simple little story for girls, by Sarah Orne Jewett, which was published earlier in the season in serial form in St. Nicholas, under the title: A Bit of Color. While not at all of the goody-goody style, it is helpful and sweet, and all the girls will love Betty. Bound in scarlet and white cloth; 287 pages; 4½x6 inches; price $1 25; Houghton, Mifflin & Co., Boston.

A SUMMER IN A CAÑON is a rather more pretentious volume bound in green and gold, and decorated with cactus and camp-kettle, containing a merry, breezy story by Kate Douglas Wiggin, written for those in their "teens." It tells of the gay doings of a bright half-dozen or so of youngsters, who, with the parents of two of them, lived in camp all through one of California's delightful summers. "California boys and girls never have to say 'wind and weather permitting' from March or April till November." The fun and frolic in "Tent Chatter" and "Tent Clatter" are woven in skillfully with fine descriptions of the trees and flowers and canons, and with some of the old-time tales. The book is exceptionally healthy in tone, and will be read with pleasure by both old and young. Cloth, 272 pages: 5½x8 inches; price $1.50; Houghton, Mifflin & Co., Boston.

THE LIFE, LETTERS AND JOURNALS of Louisa May Alcott, are brought out very fitly at this time when she was wont to have a holiday volume ready for the young people. Memoirs are often thought to be rather dry reading, but perhaps no volume of fiction was ever read with more eager interest than will be given to this life of Miss Alcott. Though edited by Ednah D. Cheney, the book is almost an autobiography, as the editor has had the rare grace of almost effacing herself, and has allowed the letters and journals to tell the story. And so thoroughly like Miss Alcott's style of public writing is the style of these papers, especially the earlier ones, that one almost feels that he is reading a new story from the pen of this loved writer.

Though it was known that she supported the family by her work, the great world outside of the family friends will be surprised to learn through what straits and sacrifices she was obliged to fight her way on her path of duty. The woes of th "March" family become almost joys before the more pathetic ones of the Alcotts. Louisa's one aim, kept always in sight, was to make the family comfortable and pay the debts, which she finally did, educating her younger sister May (the "Amy" of Little Women) and assuming the support of the elder sister's children after their father's death. In one of her "moans" in her journal she says: "When I had youth, I had no money; now I have money, I have no time; and when I get time, if I ever do, I shall have no health to enjoy life." In another place she hopes her life may help others. Her hope will be realized; for this real story of duty faithfully done, through trial and sorrow and years of painful suffering from overworked body and brain, will touch all hearts, and will lead to nobler living many whom no imaginary tale could stir. The volume is uniform in size and binding with Miss Alcott's novels, and is inscribed to Mrs. Anna Pratt, ("Meg") her only surviving sister. It contains two fine photogravures, one as she appeared at 30, and one in later life, which shows very plainly the softening effect of the trials at which she so often wondered. Cloth; 400 pages; price $1 50; Roberts Bros., Boston.

IN A FAIR COUNTRY is inscribed in gold and brown on the cover of a gilt-edged, bronze-bound treasure lately from the press of Lee and Shepard. The Fair Country is our own, lying all about us, and it is so beautifully pictured in a series of essays by Thomas Wentworth Higginson, with illustrations by Irene E. Jerome, that it is difficult to tell which are most charming. Mr. Higginson is on visiting terms with flower, and bird, and every form of country life. The text consists of: April Days, My Out-Door Study; Water Lilies; The Life of Birds; The Procession of the Flowers, and Snow. Mr. Higginson says: "Most people resign themselves to be decently happy in June; they accept it; they compliment its weather, etc. But it is time to chant a hymn of more liberal gratitude. God offers us yearly a necklace of 12 pearls." He quotes a child's definition that an idiot is one who doesn't know an arbor-vitæ from a pine. Two of his sayings might be taken to point toward the national flower question, though evidently written with no thought of it: "I is impossible to create a popular name." "The *Epigæa* is really the wild flower for which our country people have a hearty passion."

Every second satiny page has an illustration breathing the spirit of the text. While all are charming, perhaps those of Water Lilies; My Out-Door Study; and the Procession of the Flowers are especially so. There are about 100 pages of text, making a thick volume. Fortunate indeed is he who receives this elegant book as a holiday gift. Nine and a-half by 13 inches; price $6. Lee and Shepard, Boston.

A DRIFT, by Julia Ditto Young, is one of those novels that make one wonder for what earthly purpose they were written, although the scene and the inscription of the book to William D. Howells lead one vaguely to suspect that the author was trying to create character studies, "after" Howells. Many would say that it is not a bad novel, but that cannot be called good which leaves the reader, as this one does, cynical, *ennuyé*, "adrift." That all the married people should become in love (?) outside the pale of the law; and that the only unmarried woman should steadfastly refuse marriage under any circumstances; while the work closes with a double tragedy, makes it an impossibility for the book, viewed purely as fiction, to give the reader any pleasure. At the same time it helps to swell the list of books, already far too large, that lead to a light conception of the sanctity of the marriage tie. Every character in the book is a study which makes rather too much of it, though some of them are quite good. The one thing in the book that might serve to point a moral is the common feeling voiced by the weak woman who has just listened to words of passionate endearment from a man who is not her husband: "I didn't know I should ever again be precious to any one; that any one would prize as a lover does, my smile, my glance, my foolish little ways." Careless husbands might find a lesson here if they would. Cloth, 275 pages; 5½ by 7½ inches; price $1.25: J. B. Lippincott Company, Philadelphia.

HEROES OF THE CRUSADES by Amanda M. Douglass, is a collection of historical sketches, 10 in number, of men who made themselves famous in these holy wars. Among them are Tancred, Godfrey of Bouillon, Saladin, and Richard Cœur de Leon. With a wealth of material comprising so much invincible valor and so much romance, it would seem that these tales might have been made more entertaining. Perhaps the best parts are the stories of Richard and Saladin, and the summing-up, in which the author says: "Blood and treasure had been wasted for the Kingdom of Jerusalem, but who shall say that it had not saved Western civilization from the forays of an intruder, and held in check the lords of Islamism who, later, made themselves masters of Constantinople," Cloth, 349 pages: 5½x7½ inches; Lee and Shepard, Boston.

LEGS AND ARMS
WITH
RUBBER FEET AND HANDS.

Fig. 1.

Fig. 1 is from an instantaneous photograph of a man ascending a ladder; he has two artificial legs substituting his natural ones, which were crushed by a railroad accident and amputated. Fig. 2 exposes his stumps. With his rubber feet he can ascend or descend a ladder, and balance himself on the rungs. He can walk and mingle with persons without betraying his loss; in fact, he is restored to his former self for all practical purposes.

With the old methods of complicated ankle-joints these results could not be so thoroughly attained.

Over 9000 in practical use, scattered in all parts of the world. Many of these have been supplied without presenting themselves to us, simply by sending measurements on a copyright formula which any one can easily fill out. Eminent surgeons and competent judges have commended the rubber foot and hand for their remarkable advantages.

Awarded the highest prizes at every competitive exhibition.

Endorsed and purchased by the U. S. Government.

A treatise of 400 pages with 200 illustrations and copyright formula, SENT FREE.

D. LANDRETH & SON,
21 & 23 South Sixth St., Philadelphia, Pa.

CATALOGUES, ETC., RECEIVED.

W. ATLEE BURPEE & COMPANY, PHILADELPHIA, PA.—A circular of novelties for 1890. It is impressed upon the reader that these are actually *novelties* of real merit and that the descriptions are true to nature, having been written during growth at the firm's trial grounds called Fordhook Farm.

THE GENEVA GRAPE.—Circular from R. G. Chase & Company, Geneva, N. Y. This new white grape is illustrated and described and some good authorities on grape culture testify to its merits.

FRANK WILSON'S BONE MILL.—Catalogue from Wilson Brothers, Easton, Pa. This pamphlet grows larger and more valuable each year. We judge from this fact that the bone mill business constantly increases. This is just as it should be. We have used this mill for bones and shells for some years and find it a great help and a source of profit. If you keep hens, you need a bone-mill. The "Wilson" is the best mill.

TORNADO FEED AND ENSILAGE CUTTERS.—Catalogue from W. R. Harrison & Co., Canton, Ohio. There are 16 reasons given why the "Tornado" is the best cutter made. The best of it is that these reasons are all backed up by the testimony of solid and business farmers. The cutters themselves, with their distinct and peculiar parts are carefully illustrated and described so that one can readily see how they work. Any man who thinks of buying a cutter should examine this pamphlet. It is a good one.

MONARCH INCUBATOR.—Circular from James Rankin, South Easton, Mass. Mr. Rankin is one of the most successful poultrymen in the country. He gives the "Monarch" credit for a great part of his success, and from what the R. N.-Y. can learn this is a just credit. We do not think the every-day poultry-keeper will find any incubator that will suit him better than the "Monarch" This is merely an opinion. We have not tried to work any incubator.

KELLY DUPLEX FEED MILL.—Circulars from The Springfield Engine & Thrasher Co., Springfield, Ohio. The R. N.-Y. has frequently called attention to the Kelly Duplex Mill. To show what the manufacturers claim for it, we may quote from the circular as follows:

"In a mill intended for grinding feed the following things are desirable, and they constitute the essentials of a good mill:

First.—It must cut up the grain or material to be ground, whatever it is, into small, fine particles. The object is to enable the stomachs of animals eating it to appropriate all of it so that none of it is voided in the dung and wasted. If the grain is so cut up into minute particles of uniform size, the greatest possible surface is thus presented to the action of the digestive fluids in the stomach of the animals. Most mills crush a part of the grain or material into a pulp and leave the balance in coarse particles. Mills of that kind are not to be accepted as good grinding mills.

Second.—It must do the work with economy to the power.

Third.—It must do it rapidly so that the largest possible quantity may be ground in the shortest possible time.

Fourth.—It must be able to grind successfully all kinds of grain and grind uniformly well.

Fifth.—It must have a regulating device by which the operator may easily, and without the loss of time or *consumption of power*, regulate the quality of the grinding.

It is claimed that the Kelly Duplex possesses these qualities in a pre-eminent degree."

"ONE WAY TO SAVE MONEY" is to buy everything you can direct from the manufacturer and never pay a middleman's profit. Our readers have certainly noticed the advertisement of the Wilber H. Murray Manufacturing Company, of Cincinnati, Ohio, who are manufacturers of the "Murray" $5.95 Single Harness and "Murray" $55.95 Side Bar and End Spring Buggies. We take pleasure in saying to our readers that we know this firm and that we believe they will do just what they say and that any orders given them will receive the best attention. They make a full line of buggies and buggy harness and guarantee everything just as represented or the money is refunded. It will pay every reader of this paper who has not received one of these catalogues to write for it. All letters should be directed plainly Wilber H. Murray Manufacturing Company, Murray Building, 139 W. Front Street, Cincinnati, O.

LUBURG ADJUSTABLE CHAIR.—In examining the catalogue of the Luburg Manufacturing Company, we are reminded of the fact that the Luburg chair will prove most acceptable as a Christmas present. The chair is a marvel of comfort and convenience, with its 50 changes of position. Prices range from $7 upwards. This house also offers a full line of invalid wheel chairs, baby coaches, etc. Address the Luburg Manufacturing Company, 145 North Eighth Street, Philadelphia. All of these goods are offered as premiums to R. N.-Y. agents.

THE PRESSEY BROODER.—Catalogue from G. W. Pressey, Hammonton, N. J. When it is stated that this brooder is used on many of the best broiler farms in southern New Jersey, enough has been stated in its praise. It is cheap, simple and good.

THE WEAVER ORGAN.—Catalogue from The Weaver Organ and Piano Company, York, Pa. These organs are guaranteed for six years, that is, the manufacturers agree to replace one if, within six years, with proper care and use, it proves defective in material or construction. This is fair enough; is it not?

LINSEED-OIL MEAL—ITS VALUE AS A FEED.—This is the subject of a little pamphlet issued by the Detroit Linseed-Oil Co., Detroit, Michigan. There can be no doubt about the value of linseed-oil meal as a food for animals. The complaints from those who have used it may generally be traced to confounding it with cotton seed meal and to mistakes in feeding it—wrong combinations of the feeding elements. Like every other good thing, it can be abused. Farmers should know how to feed it to the best advantage. This little pamphlet will help them to such an understanding, and we hope all our friends will look the matter up.

ARTIFICIAL LIMBS.—Circular from A. A. Marks 701 Broadway, New York. If there is any reader of the R. N.-Y. unfortunate enough to need a new limb the best we can do is to refer him to Mr. Marks. He is the man whose ingenuity enables a person with both legs cut off to climb a ladder or ride a bicycle.

THE YOUTH'S COMPANION
Announcements
1890

A National Family Paper—Two Millions of Readers.
The full Announcement of Authors and Articles will be sent on application.

Six Serial Stories,
Fully illustrated, and among the most attractive ever published.

150 Short Stories—Thrilling Adventures—Sketches of Travel—Health and Hygiene—Biographical Sketches—1,000 Short Articles—Popular Science—Natural History—Outdoor Sports—Anecdotes—Etiquette—Wit and Humor—Poetry.

Illustrated Supplements
Were given with nearly every issue during the last year, and will be continued. They give an increase of nearly one-half in the matter and illustrations, **without any increase in the price of the paper.**

Eminent Contributors.
Articles of great value and interest will be given in the volume for 1890 by

Rt. Hon. W. E. Gladstone, Hon. James G. Blaine, Justin McCarthy, M. P.,
General Lord Wolseley, Senator Geo. F. Hoar, Hon. John G. Carlisle,
Sir Morell Mackenzie, Prof. John Tyndall, Hon. Samuel S. Cox,
Eugene Schuyler, C. A. Stephens, Lt. Fred. Schwatka,
And One Hundred other well-known and favorite writers.

Four Holiday Numbers
Are in preparation, and will be exceedingly attractive, filled with the special work of our favorite writers, and **profusely illustrated.**

Thanksgiving—Christmas—New Year's—Easter.

These Four Souvenir Numbers will be sent to each subscriber.

Household Articles will be published frequently, giving useful information on Art Work, Fancy Work, Embroidery, the Decoration of Rooms, Cooking, and Hints on Housekeeping.

$5,000 Prize Stories.
Nearly Six Thousand Stories have been examined. The titles and authors of those which will receive the Prizes cannot yet be announced, but the successful Stories will be published during the coming year.

The Editorials give comprehensive views of current events.
The Children's Page contains charming Stories, Pictures, Anecdotes, Rhymes and Puzzles, adapted to the youngest readers.

Free to Jan., 1890.
New Subscribers who send $1.75 now, will receive the paper free to January 1st, 1890, and for a full year from that date.

Sample copies free. Please mention this paper. Address,

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME.

VOL. XLVIII. NO. 2080. NEW YORK, DECEMBER 7, 1889. PRICE, FIVE CENTS. $2.00 PER YEAR.

Entered According to Act of Congress in the Year 1889, by the Rural New-Yorker, in the Office of the Librarian of Congress, at Washington, D. C.

The Vineyard.

MINER'S SEEDLING GRAPES—THE ANTOINETTE.

T. B. MINER spent many years of his life in raising seedling grapes, all, in so far as the writer recalls, from Concord seeds. Several years before his death, he brought specimen bunches of the varieties he most prized to the R. N.-Y. office. They were Antoinette, Augusta, Adeline, Belinda, Carlotta, Victoria, Lexington, Rockingham and two or three others not recalled as we write. These were a selection from some 1,500 seedlings which he had raised, as we have said, from Concord seeds, there never having been any pretense on his part of having made any crosses. Some time later specimen vines of Victoria, Rockingham, Carlotta, Antoinette and one or two others were sent to the Rural Grounds for testing. All died except one each of Rockingham, Carlotta and Victoria, notes in regard to which have appeared in these columns every season since. The Rockingham is a black grape of higher quality than the Concord ripening at the same time. But the berries crack open and the bunches are often loose. Carlotta is a white grape ripening a few days before Concord. The berries are sweeter than the Concord and in other respects of the same quality. The vine is a rather shy bearer. The Victoria has been so fully described that no further reference need be made at this time. The vine is remarkable for hardiness, healthiness and fruitfulness. A vine of Antoinette was sent to the Rural Grounds in April of 1886 by George W. Campbell of Delaware, O., and has borne for two seasons, the past season heavily, though the bunches were all imperfect from the injury the buds sustained from the rose beetles. The photo-engraving, Fig. 286, shows average bunches.

The vine is very vigorous and perfectly healthy and, thus far, perfectly hardy. The berries ripen with Concord or a trifle earlier. They are medium to large, round, a little flattened, yellowish white, free of rot and mildew. Pulp partly breaking, sweet; better than Concord to those who do not object to their foxiness which is more pronounced. As grown at the Rural Grounds and judged at this time, it is preferable to either Empire State, Hayes or Pocklington.

FROM SEC'Y GEO. W. CAMPBELL.

The Antoinette was sent to me by the late Mr. T. B. Miner, of Linden, N. J., its originator, nine or 10 years ago. The vine has proven a very vigorous and healthy grower, very hardy, and always free from mildew. As to productiveness: it has been rather variable; in some seasons it has borne well; in others not, and although this may be said of all varieties, I think the Antoinette somewhat less reliable in this respect than some other seedlings of similar character of Concord parentage, among which may be named Lady, Pocklington and perhaps Hayes. In general character it is much like other white Concord seedlings, all of which have a general family resemblance. Its berries are round, and nearly as large as those of the Pocklington; the clusters average smaller, though they are of fair size. It ripens about with Concord, and keeps about as well, either on or off the vine. In quality it is, when well ripened, somewhat like the Lady, but, to my taste, hardly as good.

Mr. Miner originated more than a dozen white varieties which he regarded very highly, among which were the Victoria, Carlotta and the Antoinette, the latter having been sent to me as one of those which he regarded as very promising. The Victoria he also commended very highly, and he wrote me that it was "in quality so much superior to the Concord as to throw that variety back as worthless in comparison with Victoria." He had also several black varieties which he regarded highly, among which were Belinda, Linden and Lexington. I tested them, but could not find them equal to either Concord or Worden for general culture. The finest-flavored of all his grapes I consider the Carlotta, but it is in all its characteristics so much like the Hayes that I do not think I could tell the one from the other, either in vine, foliage or fruit. Although the Antoinette is healthy, hardy and vigorous in growth, of fairly good quality, usually productive and free from rot, I hardly feel justified in recommending it as a variety likely to be found useful for general and profitable planting; but as an amateur grape to make up a variety it would doubtless be interesting, and in many places might be found successful and valuable.

Delaware, Ohio.

FROM G. W. PECK.

In the autumn of 1879 I purchased from the estate of the late T. B. Miner, in Linden, N. J., several new seedling grapevines: Linden and Lexington for black, Belinda, Victoria, Carlotta, and Antoinette for white. My collection has since been increased by about 50 other varieties representing old and new sorts, including several of Rogers's Hybrids. From nearly a decade of experience I am enabled to draw a fair average comparison of such as are suited to this locality. Among the whites, both for vigor of growth and abundance of fruitage, Antoinette bears the palm, giving bunches of six to 10 ounces of grapes as large as Moore's Early, so rich in sugar as to excel in general approval; but having a medium-thick skin and full pulp. I prefer it to the Concord and it ripens earlier.

[That the Antoinette should bear berries as large as those of Moore's Early shows either that Mr. Peck's situation and soil suit it particularly well or that he has not the true Antoinette. After Mr. Miner's death, his varieties were neglected.—EDS.]

Victoria yields a heavy crop of very large berries in attractive bunches; the vine is not so vigorous or is the fruit so sweet as Antoinette, and it has a thinner skin and less pulp. In quality it is equal to the Concord and it ripens later. It is the best keeping grape I have.

The Carlotta is not so distinguished for the growth of its canes or the size of its bunches or berries as either of the above; but to me it is decidedly superior. The bunches and berries are medium to large; the skin is thin, there is very little pulp, and it is more juicy, with a sweet, aromatic flavor. The vine bears a well balanced crop, maturing with the Concord.

Other white grapes do well here such as Lady, Walter, Pocklington, Elvira, Grein's Golden, and among the blacks Worden, Cottage, Concord. Linden, Moore's Early, Wilder and Herbert, and among the reds Brighton, Vergennes, Perkins and Lindley.

Roselle, N. J.

ANTOINETTE GRAPE (MINER'S). From Nature. Fig. 286.

Farm Economy.

WEIGHTING THE SILO.

Well-Known Men Present Their Views.

SINCE Mr. Colcord gave his reasons for using jack-screws in pressing the silage into his silo, the R. N.-Y. has been asked to state how some of the men who have used the silo successfully cover and weight their product. Letters of inquiry have called out the following notes:

FROM HIRAM SMITH.

I put on top of the silage about eight inches of green wild grass, or of any green crop that will pack closely so as to exclude the air, or tar-board paper and a few inches of saw-dust, or any kind of earth. This excludes the air perfectly. Eighteen inches of cut-straw make a good cover, which is useful for bedding, as the silage is fed out, and it is therefore the cheapest of all the covers I have used. Boards, planks and weights are expensive and useless.

Sheboygan Falls, Wis.

FROM J. M. HEATH.

The best covering for silage is about one foot of earth. When the silage settles, the earth follows it and the loss, as compared with that incurred by the use of any other method, is practically nothing.

La Fayette, Ind.

FROM OATMAN BROS.

After the silage has all gone into the silo, the top is leveled and the edges are well tramped. Then we place on it a layer of two inches of bran, or two layers of one-inch boards directly on top of it. On this we put either a light cover-

ing of stone, say, perhaps an average of five to 10 pounds to the foot, or we cover the entire surface with wheat bran. We find it a good idea to put a light weight on the silage, though a great many recommend a covering of chaff or cut straw.

Dundee, Ill.

FROM F. W. A. WOLL.

The method that we have used for three years past, is as follows: When all the fodder has been put into the silo, it is tramped down around the walls and in the corners, and leveled. Tarred building-paper is then put on the top of it, making the paper lap over some few inches along the walls. A layer of sawdust, one foot deep, is put on the top of the tarred paper, and that completes the covering. By this method we have never been able wholly to avoid the spoiling of some of the silage directly under the tarred paper. As a rule, about six inches of the top layer have been unfit for cattle food. A report has recently come to us from a prominent farmer in this State who has avoided this loss of fodder from the top of the silo by the following method of covering: On the top of the fodder he puts a layer of straw a foot deep, then tarred paper, and then another foot layer of straw. His silage is said to be well preserved close up to the straw without any mold. The method seems good, but we have had no experience ourselves as to its general utility.

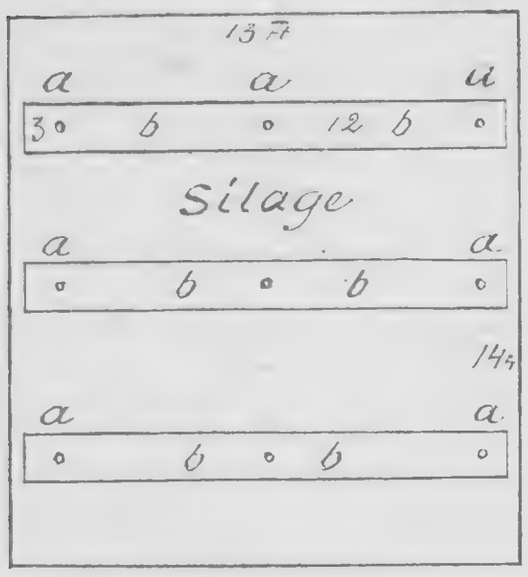

Fig. 287.

Wisconsin Experiment Station.

FROM H. A. SWAN.

After the silage has been put into the silo let it stand two days, then cut in about a foot in depth of green marsh grass (green clover will do); cover this with barn boards cut three-quarters of an inch shorter than the length of the pit, to allow them to follow the silage as it settles. Over them put a covering of tarred paper followed by another covering of narrow boards, placed over the joints beneath the paper. I have always found my silage in perfect condition on opening the pits.

Kent, Ohio.

FROM GEO. T. POWELL.

I cover my silage with about one foot of straw, with no weight. It opens well, with hardly any loss. The straw is thrown into the pig yards and quickly worked into manure. Deep silos need but a slight covering and no weight, while those only eight or 10 feet in hight require both, or great loss will result.

Ghent, N. Y.

FBOM J. T. BROOKS.

I have 10 silos on three different farms, and am experimenting each year. Last year I rejected heavy stone weights entirely; in fact I dispensed with weights of all kinds, and found there was no loss of silage in consequence. This year I acted as follows: At farm No. 1 there were four silos. Each was covered with one foot of cut straw well tramped, and nothing else. It has formed a close mat, and absorbed the moisture from the silage. I began using the latter about two weeks after packing and find it all that could be desired. At farm No. 2 there are two silos. The silage is covered with uncut hay about one foot deep and plank followers are laid loosely over the surface—there are no weights. The contents of one were fed from the time it was packed, and all the silage has been good thus far. The other silo has not yet been opened but I have no fears for the result. At farm No. 3 there are four silos. We are now feeding good silage from one which was filled in September 1, 1888. The other three pits were filled this year and covered with uncut straw, and plank followers laid closely over the silage without weights. After five years' experience I learned that heavy weighting is entirely unnecessary. In 1888 I filled 10 silos; the silage was cut, as usual, in half-inch lengths, pretty well tramped when put in and covered with hay or straw, then with tarred paper and followers fitting closely, and weighted with only a few sticks of wood to keep them in place. The silage was good at each farm as long as it lasted, which was till August 1 at farms Nos. 1 and 2, and we are still feeding it at No. 3.

Salem, O.

FROM J. T. EDWARDS.

I weight my silage by a plan devised by a certain Dr. Bailey of Massachusetts. I have three silos each 13 by 14 feet. We fill each pit until the silage is within five or six feet of the top. Then we smooth it down and lay on it three planks through which nine bolts four feet long have been thrust upward as shown at Figure 287. Then we place on these planks some short ones, as shown in Figure 288. Then we proceed with the filling until the silage is nearly to the top of the bolts. We cover with planks over which we place three scantlings with bolts going through each, as seen at Figure 289. Next we take a two-foot wrench, we turn up the nuts of the bolts so as to compress the four feet of silage into a cheese about 2½ feet thick. This will preserve the four feet of silage, and these four feet will make the weight to press the rest. If one cannot turn up the nuts to press the four

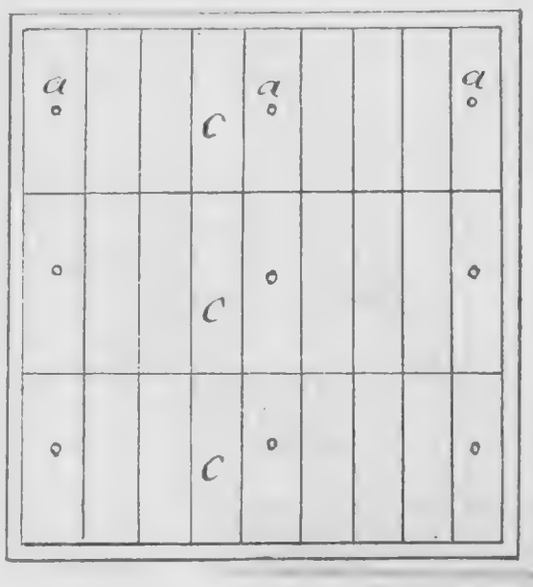

Fig. 288.

feet into 2½ at the first attempt, he should repeat the operation for a few days and he will soon press the stuff to the required solidity. Silage thus weighted keeps perfectly, as I have proven for years, and there is very little trouble or expense in preparing it. When ready to feed, simply remove the planks and take off a shaving every day. The planks need not be replaced.

Randolph, N. Y.

Explanation of Figure 287 shows the three planks placed on the top of the silage. The planks are b b b and the bolts a a a. The short planks are put on as shown at Figure 288 in which the bolts are a a a and the planks c c c. The top is shown at 289 in which d d d represent the planks e e e the three scantling and a a a the bolts. The whole system of cover and press is shown at figure 290 in which all these letters are repeated.

FROM E. P. CLARK.

My silo has been in use four seasons. Two days after the silage has all gone into the pit, we cover it with six inches of straw, then put on a double layer of boards, and on top of this four to six inches of sawdust. This method of covering is quite successful.

Mahoning, O.

FROM C. R. BEACH.

This is my third year with silos. As to how I cover after the silage is all in: The first year I covered with boards; then with tarred paper; then with about a foot of dry marsh hay, weighted with a few fence posts. The silage kept well. Last year I covered with tarred paper and the same amount of hay, omitting the boards, and I did not weight. The silage was injured five or six inches. This year I covered with fine rowen grass five or six inches deep, put on green, and on that about a foot of barley chaff and fine straw (omitting the paper and boards). The silo was thoroughly tramped every two or three days. I opened it yesterday; but little, if any, is injured. Anything will do for covering that will exclude the air, and if the silage is occasionally tramped, weighting can be omitted.

Whitewater, Wis.

MORE ABOUT SELLING CROPS.

ARIZONA.

P. O., DUDLEYVILLE, Pinal County.—We had our first frost October 29th. I cut my last crop of Alfalfa—the fourth cutting was made October 26—about 45 tons from seven acres. One half of the seven acres has been seeded nine years and the stand is good. No manure has been put on the ground. It has been irrigated sometimes once and sometimes twice between cuttings. All crops are a good average. Not much oats or rye is raised in the Territory.

W. A. L.

CANADA.

DELAWARE, Ont.—I am breeding thoroughbred stock. The crops grown here are mostly such as can be produced at the least cost and to the best advantage. The only crops sold are wheat and occasionally barley. My experience with wheat has been such as to teach me to sell as early as possible. I grow a very superior sample and most of it is required for seed. This season I was about the first in the market with wheat and I got 96 cents for milling purposes—several cents more than it could be sold for now. The same was the case last year and again in the previous one. I believe the proper time to sell is when one's produce is ready for the market, whether grain, beef, mutton, or pork. One should let the Chicago bulls and bears do the speculating. It is their game and should be left to them.

R. G.

DAKOTA.

ORDWAY, Brown County.—My chief crop is wheat. I sell in the fall generally for help, thrashing and machinery bills due in October and November. I take a lot of papers, farming and general newspapers, to keep posted. Many are believed to be printed in the interest of the wheat-buying ring which has all the strength of the Big Four in the beef business in Chicago. Bills payable cause me to sell. I hold when I can, and have hopes for better prices. I believe ,the crops of the Northwest, and of the entire country for 1889, to be grossly exaggerated, and that products will be worth more before seeding time.

M. O. H.

BON HOMME, Bon Homme County.—My main crop is hogs. I watch the Sioux City and Chicago markets on mess pork and hogs. The price of mess pork is quoted a month or two ahead, and the mess pork governs the market for hogs a great deal in

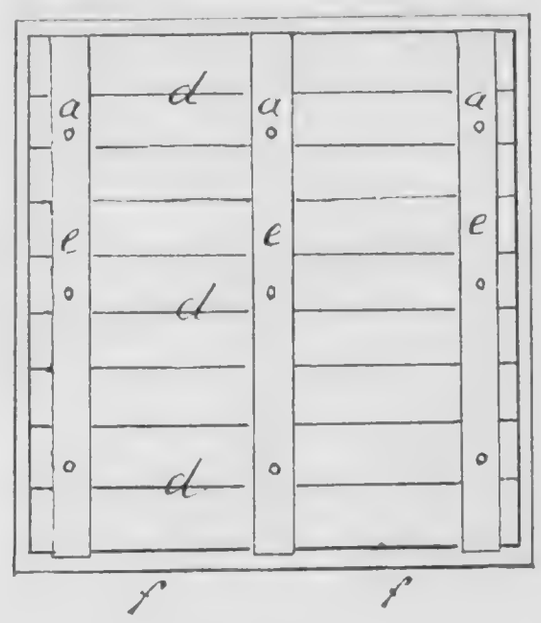

Fig. 289.

this country. If mess pork is quoted lower for December than for October I get my hogs on the market as early as I can and *vice versa*.

F. W. H.

OUR principal crop at present is wheat. We have not been able to find any truly reliable reports to depend on, as the markets seem to be controlled to a great measure by grain-buyers. I keep posted as to prices as well as possible through the different papers. Wheat is mostly marketed in the fall at the convenience or need of the holder. During the last six years wheat has averaged a better price in the fall than in the winter or spring.

H. T. D.

Ipswich.

ILLINOIS.

MOUND FARM, Kankakee County.—M chief products are Short-horn bull calves, hogs and potatoes for seed. The calves run with the cows until fall and are sold when from six to eight months old, bringing from $40 to $60 apiece. After the calves are sold the cows are milked and butter is made and sold to private families in the city. The heifer calves are taken from the cows about the same time. The sows drop their pigs in May and June. The sows are fatted and sold in November; the pigs are held until February, the Chicago market governing the time of selling. They are fed all they will eat from the start. The potatoes are left in the ground as long as it is thought safe, then dug and pitted as soon as possible. Round holes are dug about two feet deep and large enough to hold from 25 to 30 bushels below the surface of the ground. The potatoes are left higher in the center, and are covered with straw and earth. In such pits they will keep fresh and without sprouting until wanted. They are sold to farmers about planting time. The Thorburn has disappointed me. I thought it one of my best. Out of 75 bushels I could not find one without scab. Most of the grain that is grown on the farm is fed out. When I get anything ready for market it is sold.

T. C. D.

STILLWELL, Hancock County.—My chief products are wheat, pork and corn. I sell my crops during the winter when the market is not glutted, as that is the most convenient time to market. I rely a good deal on the crop reports in the different papers I take. The RURAL NEW-YORKER is my chief source of information. Crops this season are up to the average all round, except late potatoes. Stock of all kinds looks well. Pastures are good. Apples are about one-third of a crop.

J. B.

MENDOTA, La Salle County.—Stock of almost all kinds are put upon the market hereabouts at almost all seasons of the year. Corn and small grains are sold when ready or when the money for them is needed, whether the price is high or low. My neighbors have been selling their last year's crop of corn to make room for this year's crop for from 25 to 30 cents per bushel. This is a reading age and every farmer's boy from 10 to 15 years old knows all about the markets in Chicago—which is our market. My family read 10 newspapers and all of our neighbors' families are well supplied with reading matter—foreign as well as local papers are commonly taken. Saturday is a gala day in Mendota for the farmers who come in and talk over everything and have a general, jolly, good time.

O. C. B.

INDIANA.

EVANSVILLE, Vanderburgh County.—The majority of our farmers are not in a condition to hold their crops for high prices, so they have to sell as soon as they get any particular crop ready for market. Others who are able to hold do so and sell at the best prices. Wheat, oats, corn, potatoes and hay are our principal crops. Wheat sells for from 60 cents to 70 cents; oats, 15 to 20 cents; corn, 25 cents to 30 cents; potatoes, 20 cents to 25 cents; hay, $10 to $16 per ton. Wheat is looking up, and those who have kept their wheat crop will I think get a dollar a bushel before two months. Two wide-awake papers are published in our city, which give us both home and foreign markets. We have a city of 50,000 inhabitants that gives us a very good home market. Our wheat harvest commences about the middle of June, and thrashing about the first of July and those that cannot hold their wheat sell as soon as it is thrashed. Oats are harvested soon after wheat and are thrashed at the same time as wheat. Corn is gathered in October and November, potatoes are dug also in the same months. We have been blest with abundant crops this year but prices have been low.

ENTERPRISE, Spencer County.—I find,

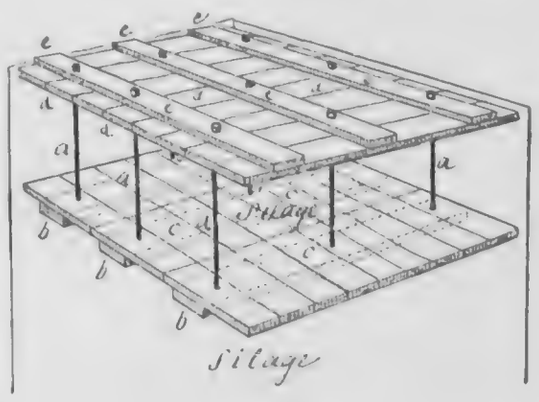

Fig. 290.

taking one year with another, that it pays to sell when a crop is ready for market; but sometimes I hold. Newspapers, crop reports, the R. N.-Y., price-currents, etc., keep me posted in regard to markets. Our crops are the staple ones. Market facilities are

good and we generally sell when a crop is ready. E. L. H.

I GROW mostly perishable crops in the way of small fruits for local markets when the Chicago market will not justify me in sending the goods there. The prices of the wheat and hogs that I sell are governed by the supply and demand at the Chicago and Buffalo markets, as quoted by three of the leading weekly papers and also the RURAL NEW-YORKER which is examined thoroughly every week. G. A. F.
Bristol.

I SELL my products at harvest time and during the fall if prices are fair; if they are very low I hold on till spring and then sometimes lose money owing to shrinkage and the low prices then ruling. I have already sold my wheat for 70 cents per bushel, and last week I sold my apples for 30 cents. Men from Indianapolis bought thousands of bushels of apples at that price. I sold my potatoes last fall for 50 cents; this spring potatoes sold for 20 to 30 cents. I keep myself posted by reading the R. N.-Y., and the other agricultural papers and a Louisville and Indianapolis paper. Potatoes are worth 20 to 30 cents here now. I am holding mine. I will sell whenever I can make a living profit on my labor and investment. E. W.
Salem.

OUR chief crops are hay and corn. I sell in the fall; the loss by shrinkage over-balances the profit if held until spring. I keep posted by reading the market reports in the Chicago papers and the RURAL NEW-YORKER. D. T. S.
Hebron.

IOWA.

NORDNESS, Winneshiek County.—We practice mixed farming. Our money crops are hogs and cream, which is sold to the creameries by the inch—present price 17 cents. We sell a good many horses which are exported both east and west. Our county is famous for good horses. We also sell beef cattle, barley and flax, which are sold as soon as thrashed. Very little wheat is raised. I sell my hogs when they weigh 200 or 225 pounds except those that I keep for breeding purposes. I hardly ever hold for higher prices, as Boards of Trade make prices too uncertain. I sell when my stuff is ready for market. O. G. H.

MARION, Linn County.—The best results will be obtained on the average of years by marketing all grain crops as soon as possible after harvesting. Fat cattle and hogs are kept thriving all the time and sold as soon as ready. Sometimes we hold for a rise, but maybe we don't get it. C. E. M.

KANSAS.

SPIVEY, Kingman County.—Wheat, corn and hogs are our chief crops. Most of us sell after thrashing, but a few hold till later. We have not made anything by holding this year as yet. Last year those that held made over 50 per cent. Kansas City is our market, so we look to their reports and I gather information from other papers including the R. N.-Y. I think it is a good plan for us to give our opinions through the R. N.-Y. regarding the holding of crops every fall before marketing. Success to the RURAL! I. B.

PRINCETON, Franklin County.—In this part of the State the chief crops are usually sold as soon as harvested. The principal crops are corn and millet and we mostly feed both to cattle and hogs. We milk the cows and sell the butter to customers at a stated price. J. F. H.

MASSACHUSETTS.

CENTRAL VILLAGE, Westport County.—I keep from four to six cows and make all the butter I can which sells to family customers for 32 cents per pound in Fall River, with a constant demand for more the year round. I also keep two or three sows and raise pigs which are sold when eight weeks old, if there is any sale for them. This fall I have two litters of pigs, but there is no demand for them, so they will be well fed until about six or seven months old and sold for pork at whatever price the market will give. Corn is quite low so I will not worry about the cost of feeding. I generally raised some potatoes, but this year they rotted so badly that I shall have but few if any to sell. They are usually sold when I think I can get the most for them or when I want most to turn them into cash, as potatoes are always a cash commodity in this locality. I look to the R. N.-Y. for information as to the crops in the country at large, and to the local newspapers for the state of the markets near by. A. D. M.

MINNESOTA.

PINE BEND, Dakota County.—My chief crops are butter, pork and potatoes. My butter is marketed every week, and the pork is mostly sold in January and February, and the potatoes are marketed in the fall. I keep posted on the market through the papers, but don't believe in holding any crop for better prices. F. M.

THE greatest rush to market our products is during September and October. By reading the market reports of our leading agricultural papers we keep posted on prices. Some sell because they have to; others whenever they have the time to deliver the goods. Many hold their wheat on account of the shortage in the crop.
Madelia. H. L. J.

WE sell our main crops, which are wheat and flax, just as soon as we get them thrashed or about the first of September, (in case of necessity). Most of the farmers in this part of the country sell most of their grain in the fall and in the spring buy seed at an advanced price. We try to keep posted on prices by noting the quotations in different cities. We have no crops this year. G. H. I.
Rosewell.

WE sell our products as soon after harvest as the crops are ready and prices satisfactory, and try to keep posted by reading the reports in several farm papers and other reports. If the market is above the cost of production, we sell, but if below, then we hold and feed. Our main crops are hay, barley, oats, corn, and potatoes. We sell what pays and feed the rest. The returns from the latter come back with good interest in better-fed stock, a little more butter, more meat, and better crops for the future. J. A. T.
Austin.

MY chief crops are barley and wheat. This season I raised 3,000 bushels of the former and 2,000 bushels of the latter. I make it a rule to sell barley in the fall and wheat the next season. I thus get an average price. If wheat should advance owing to a failure of crops or speculation I would reap the benefit. Wheat, as a rule, will average lower in the fall; but occasionally it may be higher. In this State farmers sell in the fall making the receipts in the various markets heavy, and depressing prices. I take six agricultural papers and two dailies, and keep well posted on the outlook, but it is a hard matter to strike the highest market. C. W. M.
St. Charles.

PENNSYLVANIA.

LIBRARY, Allegheny County.—We are within 10 miles of Pittsburgh and with the exception of wool, we do not sell any of our products in bulk. We endeavor to estimate the crops of the country at large, and in this the R. N.-Y. is of great assistance, and if we consider any special crop or product short, we hold for a time, otherwise we sell when we have our crops fairly ready and when we can conveniently haul them to the market. As a general rule though we consider it best to sell when our crops are fairly ready for market and rarely hold a crop over from one season to another. J. C. B.

SOUTH DAKOTA.

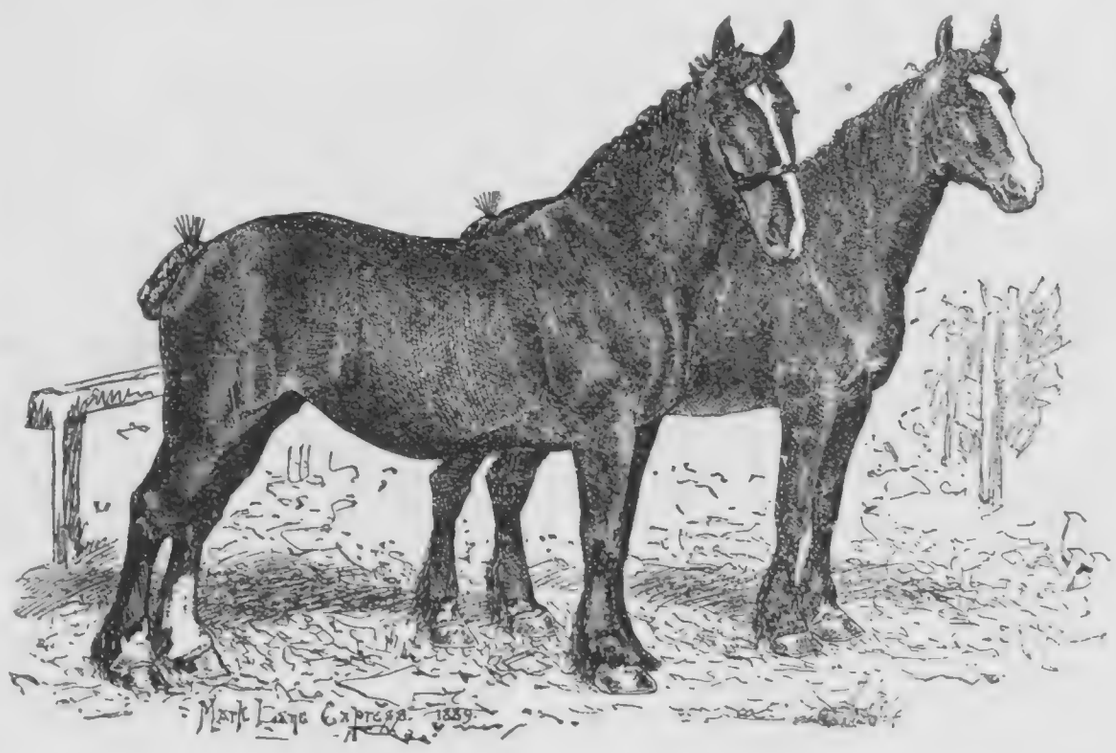
RAYMOND, Clark County.—There will be great hardships in this valley this winter. The railroad company is to haul coal in free *of freight*; but many have not money to get it at the mine price. There is no other help in sight and all of our people have a horror of county aid as taking it would class them as paupers. T. M.

VIRGINIA.

NEWBERN, Pulaski County.—I generally hold my wheat until spring and feed all my corn to my stock, as nearly all our farmers do. We have a home market for more than we can produce of corn and wheat. Corn is shipped here from the West and sold and controls our market. Ours is a grazing country, and beef is so low that there is nothing in it. Our neighborhood is now trying a creamery with some success. I believe it is the thing for us, as we can raise our calves and do not have to buy and drive from a distance. Our creamery butter sells very readily at 30 cents per pound. B. F. M.

WISCONSIN.

CALDWELL, Racine County.—Our chief products are potatoes, barley, oats, pork, wool and garden truck. The latter must of course be sold when in proper condition, and as a rule it pays best to market potatoes direct from the field, the exception being when prices are low in the fall and the crop of the country is below the average, as the case seems to be this season. Hogs and any other live stock, should be sold as soon as they are fat; but we try to have such stock in a marketable condition at a season when the receipts are the lightest. The latter part of the wool season we have found the best as a rule, selling if we can when there is the most competition among buyers. In the marketing of grain crops we try to keep posted as to the probable demand; then avoid selling at a time when the bulk of the crop is forced upon the market, as buyers take advantage of the necessities of the grain-grower more than they can in any other branch of farming. We are very often able to take advantage of an early market in a year when the old stock of grain has been consumed and there is a demand for immediate consumption. I keep myself posted on the general markets by taking a daily paper, and get all statistical information I can from government and commercial reports, and from crop reports in the several periodicals for which I subscribe, among which the RURAL NEW-YORKER ranks as one of the best. A. U.



TWO CROSS-BRED GERMAN MARES.

RE-ENGRAVED FROM THE MARK LANE EXPRESS. FIG 291.

Horseman.

GERMAN CROSS-BRED MARES.

AT Fig. 291 we reproduce a picture which recently appeared in the Mark Lane Express, an English paper, familiar to many of our readers. The picture is of particular interest for two reasons: 1. It shows the prize winners in the draft trials at the recent great German agricultural show. The team here shown drew a load of three tons 12 cwt. for a distance of five-eighths of a mile in eight minutes and 30 seconds. This load was taken in a heavy four-wheeled farm cart. 2. The picture shows the shape and physical peculiarities that may be expected as a result of cross-breeding with the English draft horse as a sire. The foremost mare is a cross between a Clydesdale sire and a Hanoverian mare. She is four years old and weighs 1,243 pounds. The other mare is five years old and weighs 1,508 pounds. She is a cross between a Shire stallion and Saxonian mare. There is a demand for good specimens of the English draft horses in Germany. The Shires and Clydesdales are much desired for crossing on the best mares of German raising. The imports of these horses to this country seem now to be dropping off since it is likely that our home-grown draft horses are about as good as the average of those in England.

Rural Topics.

CLOVER PROBLEMS.

DOES a clover sod enrich the soil? in other words, does it *add* plant food to the soil or does it simply change the elements already in the soil so that they can be more readily assimilated by the succeeding crop? My idea is that it *adds* a mere trifle, if any, of nitrogen from the air; but that by aid of its long roots it regains more or less of what has been lost through leaching. Now, if my idea is right, it seems to me that it is only a matter of time when Mr. Terry's land will fail to produce the crops he now gets. His rotation is clover, potatoes and wheat. The clover that he cuts he feeds and returns to the land. The potatoes are taken away entire. The grain—wheat—is drawn off and the straw is returned. I understand he keeps no cows and that he buys no grain to feed, nor does he grow any for that purpose. Now if he buys no manure, I am at a loss to see how he returns the plant food which he takes off in his potatoes and wheat. Will Mr. Terry, please, enlighten me on this point? The above was suggested by Mr. T.'s article on his crop rotation on page 676. P. G.
Oswego Falls, N. Y.

FROM T. B. TERRY.

The R. N.-Y. writes me that it proposes to have a series of articles from scientists as well as practical farmers bearing on this point. I write entirely from a farmer's stand-point, from 20 years' experience, from the pay-debts-and-get-ahead side. I do not know whether clover-growing "adds any plant food to the soil" or not; or whether my soil and sub-soil would analyze as rich in nitrogen as they would have done 10 years ago. I cannot help thinking that they would; but of course that doesn't prove anything. This, however, I do know that my farm was never in a more productive and satisfactory condition than it is to-day, as far as crops this season and surface indications for next are concerned. I can show to-day as magnificent a growth of clover as any man could ask for. My wheat yielded 38 bushels per acre, on all the land sown, and was perfect in quality. My potatoes brought us over $100 an acre, on all the land planted, and were free from scab and of the finest quality. I think I never had a better show for wheat at this date than I looked at out of my window to-day.

Let me tell just how these crops were raised. The field where the potatoes grew has been fertilized with clover only for some time. Neither stable manure nor fertilizer of any kind whatever has been put on it since it was in potatoes last. The first crop of clover last year was cut and taken off for hay. The second crop, which would have made about two good loads of hay per acre, was left to fall down and was plowed under this spring. The wheat was grown in two separate fields. In one the potatoes preceding it had been manured with clover sod and clover haulm, and in the other with clover sod and stable manure of the best quality, from our covered shed and cement floor. I expected the latter piece to be the best. There was the largest growth of straw. If anything, this field was the best wheat land. But I determined to know at thrashing time and not to trust my eyes; so the grain from one field was put on one side of the thrashing floor and that from the other on the other, and the clover-manured lot gave us just 40 bushels per acre, and the other about 36. This is but a single experiment; but clover haulm from which seed has been removed

and the second growth of clover when plowed under have always shown excellent results.

Years ago I used to try to save all the clover possible for hay. Then I fed it out during the winters in the way by which I could make the most out of it. Such experiences as the above have for some years made me—particularly as there was so little to be made from feeding any kind of stock—let as much of my clover as possible go back to the land without coming to the barn. I have only put in this year 20 or 25 loads, against a possible 90 or more. We shall, however, take the seed out of about half of the 70 loads—four large stacks. To leave 35 loads of hay to rot on the surface of our fields many would think wasteful. It might be in some localities; but I doubt whether I could do as well in any other way. My newly-seeded clover—after wheat this year—was mowed twice, when from eight to 14 inches high each time, and the crops were left to mulch the surface. I wish every reader of the RURAL NEW-YORKER could walk with me over the field and see what a thick, strong growth can be made in this way. The practice not only thickens the clover and kills the weeds but mulches the surface so thoroughly as to greatly benefit it. I fully believe that this clover has brought me more clear money in the end than I could have got out of it by cutting and feeding it, and much more than by pasturing it.

Twenty years ago last spring, I sowed my first clover seed, on land that was considered so poor that my tenant refused to plow it and plant it for all the crop. I also began buying manure in town and drawing it over two miles to bring up another lot. For some years I thought, with the writer of the above letter, that I must return as much plant food to my soil as I took off to maintain its fertility and more in order to bring it up. Trials of clover and manure side by side for years at last opened my eyes. I began to see that clover might be so used that it would pull me out of debt and into comfortable circumstances, so I gradually changed my farming, sowed clover for all it was worth and made money at a rate never before dreamed of. In a few years I began pushing the claims of clover for the benefit of others. It seemed as though every one was against me, and the papers were full of "clover sickness," "soil exhaustion," etc., etc. Men who knew nothing about it tried to prove that my farm had run down, that my potatoes were yielding but little, and that their quality was very poor and that I was going to the dogs generally. For two or three years I did draw pretty heavily on clover and tillage; but no drafts went to protest! I had got all out of debt and wanted some new buildings. They were built and furnished at a cost of nearly $6,000. All of the outlay was paid cash down. Then I eased up in my drafts on the clover fertility.

All the battles I have fought for clover have been to help others who needed help as badly as I did years ago. What is the use, my friends, of pulling away at the horns and tail (nitrogen from the air or not) while some one else quietly gets the milk? It may be only a "question of time" when clover will fail us. Oh dear! so it is also when our oil and gas wells and coal mines will give out; but who fails to work them on that account? Don't buy a horse or cow or tool: it is only a "question of time" when they will fail! It is well to be reasonably cautious, and to look out ahead; but too much worrying on such points isn't wise. Better make the most of what God puts in our hands to-day. When clover fails, how do you know that something better will not be found out? The air is loaded down with nitrogen: may not God endow some man with sufficient brains to find a way by which this can be fed to crops when there is a necessity for it? The writer was brought up near the ocean, and well remembers how old men used to worry in their day about what their children would do for oil when the whales gave out. Haven't we something far better now? And before that gives out electricity, almost equal to sunlight, will be lighting most of our houses.

I do not worry a bit over my clover farming. Why should I? It has brought a run-down farm up to productiveness. We have got out of debt and comfortably fixed. We shall have enough to put in the savings bank this year to buy almost as many acres as our crops grew on. "By their fruits ye shall know them." This is a better rule to go by than to pay too much attention to analysis and science. "We know in part." Science has frequently been caught proving (!) that a thing couldn't be done just at the very time that practice had accomplished it. What is science, any way? Why simply our best present knowledge, which may be found wrong at any time. Our greatest scientists are very cautious about saying anything positively. When we hear some of the small guns shoot on the clover and nitrogen question, it reminds one that "a little learning is a dangerous thing."

I ought to say, perhaps, that my farm was originally good land; but it had been abused until it would produce almost nothing. It is better adapted to clover-growing than some of the clay soils. However, I have some heavy clay, tile-drained, where clover does about as well as on lighter soil. The trouble with many in growing clover has been that they haven't given it as good a chance as they should. They have sown Timothy the fall before, or pastured the young clover, or let the weeds choke it, or let it stand too long. It cannot take all sorts of abuse and still do its best for the farmer.

Summit County, Ohio.

DOES A CLOVER CROP ENRICH THE SOIL?

A LETTER FROM SIR J. B. LAWES.

DOES a clover crop enrich the soil? There is no evidence, so far as I know, that it does. A very rich soil where we have grown clover for more than 30 years in succession is greatly impoverished. But better crops of grain are grown after clover, although it is true the clover hay has carried off large quantities of the food contained in the soil; and, further, we have satisfied ourselves that the soil for the first nine inches from the surface is richer, *i.e.*, more competent to grow a larger crop of wheat than it was before. Part of this increased food is certainly derived from the subsoil; whether all of it is so derived there is no evidence to show. Mr. Terry grows clover, potatoes, and wheat, exporting the grain of the wheat and the potatoes. Why not? Because he is exhausting his soil; would it not be better to say he is reducing its fertility, and is not all economic agriculture based upon the removal of fertility? I suppose that no other person has tried so hard as I have to exhaust my soil, and yet what is the result of 50 years' experience? That upon a soil which has no pretension to be called a rich soil, the bulk of the fertility is still there.

Rothamsted, England.

Farm Topics.

Abandoned Farms

WHY

QUIT FARMING IN NEW HAMPSHIRE?

WHAT'S THE MATTER WITH EASTERN AGRICULTURE?

FOR the past few months the papers have been full of accounts of the "abandoned farms" in New Hampshire and Vermont. If one were to take these reports just as they are written, it would be safe to presume that these States are being gradually depopulated; that whole sections of good farming land are going back to the original wilderness and that the old New England farmer, that sturdy type of Americanism, famed in song and story, is passing completely out of view. Certainly this is the impression prevailing at the West, and the R. N.-Y. has received many letters from Western farmers asking why it is that farms located within 50 miles of great manufacturing centers and within 150 miles of large and prosperous cities cannot be made to pay. Is Eastern agriculture doomed? Is the West to supply all our food? These are the questions asked by those who hear only one side of this matter, not knowing of the thousands of prosperous and intelligent farmers in these very States of Vermont and New Hampshire who succeed where others fail. We have heard too much of the "abandoned" side of this matter. Those who have these farms for sale are very anxious to find customers. The State governments are in the land agency business to the extent of booming these deserted farms. It is not strange therefore that we hear all about them. The R. N.-Y. recently received a long list of the names of those who had New Hampshire "abandoned" farms for sale. It occurred to us that these men could give the best of reasons for the condition of agriculture that has led to the present state of affairs. We therefore communicated with a number of them, asking why they wished to sell their farms and why farm lands in New Hampshire could not be made to pay a profit.

The following letters tell their own story. After reading them one may well ask: "What's the matter with New Hampshire agriculture?" The answer will, in the R. N.-Y's. opinion, be very close to the following statement recently made by President J. M. Connor of the Granite State Dairymen's Convention: "The price of every kind of labor except farm work is going up and the rising generation are too anxious for a 'soft snap' to linger round a New Hampshire pasture long."

FROM HALE CHADWICK.

I have for sale a farm of 500 acres located on a clear stream, and the tillage land—about 50 acres—is smooth and level and can be mowed with a machine. The farm was abandoned because of the death of the owner and all his family. Another farm is in Merrimack County and consists of 200 acres. The tillage land is smooth and level and a good strong soil—as good as any in the State. There are plenty of fruits—apples, cranberries, etc. It is unoccupied by reason of the death of the owner; the boys all left the old home for the village or city, and the father having died the farm was left desolate, like hundreds of others in this and other States.

Merrimack County.

FROM J. L. DRAKE.

The farm spoken of is not unoccupied, for I cultivate the land and rent the buildings. It was left on account of the poor health of the owner and an attack of Western fever which is the principal reason for the desertion of farms in our section.

Carroll County.

FROM J. D. HUNKINS.

The reason why the farm in question is deserted is that the man who owned it before me is about 80 years old, and consequently not being able to carry it on he was obliged to sell. I bought it for the wood and pasturage, and as I own another farm in the village, the buildings (which are in good repair, needing only paint) are of no use to me, so in order to sell these, I am willing to sell some land with them. It is a good bargain for any one who wants a home. It has a good location and would be a fine place for a summer residence. Four good families are living within one-fourth of a mile. The depot and post-office are only two miles away, and there is a good easy road to them. Quite a good number of our oldest farmers have died within a few years. Aside from the loss caused by these, I am inclined to believe that farming is carried on as extensively as it ever was. We have a hosiery mill here, which, of course, gives employment to a good many who would otherwise have to pay more attention to farming.

Belknap County.

FROM H. D. MARCY.

The farm referred to is owned by parties in Vermont and the man who has occupied it for several years did not pay the mortgage and concluded to give it up, and deeded it back to the parties holding the mortgage. They wish to sell and offer it as a deserted farm, as there is no one on it. It is a good stock farm and is mostly fenced with stone walls. It has running water and a house and barn, the buildings need some repairing and any party who is willing to work can make money by buying it.

It is 1½ mile from the village, where there are stores, a depot, church, etc.

Grafton County.

FROM G. E. WILSON.

I want to sell because I have more land than I need. I have only been here five years and the only particular trouble I can see is that this town has had a considerable amount of the war debt to pay since I have been here; but now nearly all is paid. It has made our taxes about double what they would otherwise have been, and a good many who were shiftless and improvident and who liked rum and cider better than work had to leave their places and go to work out and that makes it harder for the others.

Grafton County.

FROM G. R. STEVENS.

The farm I have for sale was deserted because of the death of a childless old man. It was sold at auction and I bought it. The desertion of the farms here is mainly due to the death of the owners who leave no one to take their places.

Rockingham County.

FROM A. B. DEERING.

The occupants of the farm have died, and it fell to me. Having another, I wish to sell this as I am not able to carry on both. It is in a good state of cultivation and pleasantly situated.

"What seems to be the matter with farming in this neighborhood?" The old folks have died off, while the younger people have gone to the cities. That seems to account for so many unoccupied farms in N. H. It certainly does in this vicinity.

Carroll County.

FROM H. B. WHITNEY.

This farm of 180 acres is one of the best and was owned by one family for 100 years. It was finally sold because the last owner died about three years ago. I bought it two years ago. I offer the 180 acres for $1,200, reserving all the timber except that on about 20 acres which is a sugar orchard of 1,000 to 1,500 nice Rock Maples on good ground. The rest is mostly hard-wood. There are about 40 acres in mowing which can all be cut with a machine. Nearly 75 acres are in pasture. The farm is level and is fenced with stone walls. The buildings consist of a dwelling-house 32 by 40 feet an L 16 by 20 feet, with a shed 50 feet long for wood and carriages. There are also two barns: one 34 by 56 feet, and the other 26 by 34 feet. Those are in good repair. There is a shed 34 feet long attached to the barn to serve as a stable. There are also a tool-house, a piggery, a corn-barn, and a bee-house all in very good condition. There are plenty of apples, pears, plums, and grapes. The farm lies about 2½ miles from West Canaan and about the same distance from Enfield at both of which places there are railroad stations. It is only eight miles from Dartmouth College in Hanover. There is a creamery at West Canaan. This is a good farm for a man who keeps cows. It is a level farm. I offer it at such a bargain because I have more real estate than I want. I have one or two other farms to sell.

Grafton County.

FROM H. O. HADLEY.

The farm which I have for sale is situated about two miles from the village of Temple where there are stores, a church, a hotel, etc. The former owner of the place sold it to me as he had a good chance to engage in the grocery business in one of the adjoining towns. He had bought it about 10 years before, having paid $3,400 for it. He had less than $1,000 to start with, yet he paid for the place and had it all clear of debt before he left it. It will maintain 20 cows and two horses the year around at present, and could easily be made to maintain twice as many. The building consists of a good two-story house with brick ends in good repair. There is an adjoining L 20-x30 feet one story high. It needs shingling and a few other repairs very badly. Adjoining the L is a shed 20x50 feet and near this are two barns. No. 1 is 48x36 feet and No. 2, about 30 feet from the first, is 64x28 feet. There are also other sheds and a hen-house. It is estimated there are 600 cords of hard wood on the place, and there is an abundance of apples, pears, cherries and grapes. It is about a quarter of a mile from school, and 50 rods from the nearest neighbor. The nearest railroad connection is at East Wilton or Greenville, each six miles distant. The only reason why the farm should not sell quickly for $5,000 or more, is because the main road does not extend beyond the house, so that the place is of course at the end of the road. The road is good, however, and there are no gates on it and the main roads are just in sight less than a quarter of a mile away. The only reason why there are so many deserted farms in this State is because the young men of to-day are too lazy to work.

Hillsborough County.

FROM GEO. MUNSON.

My farm is not properly on the abandoned

CONSTRUCTION OF SILOS.

H. T. K., Pruct, Ky.—At the convention of the Central Ensilage Association at Cleveland, Ohio, H. Talcott, Assistant Dairy Commissioner, stated that frost or freezing in a silo was not to be considered in building one, and that one thickness of matched boards was all the wall necessary. No solid masonry was needed he said, or double boarding with paper between, or anything but one thickness of planed matched boards. Is such a silo generally successful?

ANSWERED BY JOHN GOULD, OHIO.

It is becoming apparent that Mr. Talcott is right so far as frost and freezing have any influence upon silage. A stone silo wall 20 inches thick, is not as good a protection against frost or freezing as a single thickness of plank. Further, it is not probable that any man who builds a silo in Kentucky, will ever see any frozen silage. It is rarely that a pit of silage ever cools down much, if any, below 75 or 80 degrees, and thus it affords itself excellent protection against frost. Stone walls against silage have a tendency to conduct frost

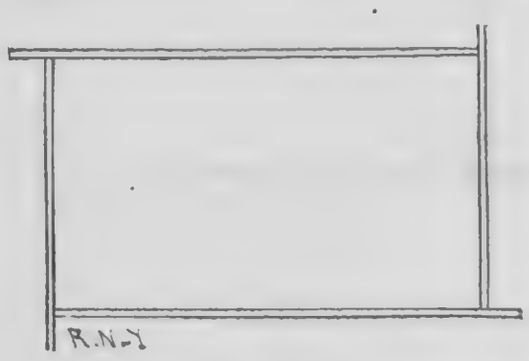

Fig. 292.

through them and cause condensation of moisture against the inside, and the contents are more or less damaged. No such injury is ever seen with a wooden wall. While I still think that in some respects double lining, with tarred paper between, is preferable for the general silo, I am so far convinced that the single boarding is sufficient, that next season I shall board one in this way in which to ensilo my oat crop. I am led to this opinion by the fact that gas-tar and gasoline make an absolutely moisture and air-proof paint, quickly and easily applied, and which promises to make wooden walls as permanent as concrete, which has a habit of cracking, owing to frost and other causes. The single lining needs more studding than double boarding, and I would set the studding as close as 16 inches from center to center. I would put on the matched boards horizontally, grooves up, and as each layer was put on, I would fill the grooves with the gas-tar and gasoline, using an old tea or coffee-pot for the purpose, and then crowd the tongue of the next course of lumber into it. When all is complete, paint the whole interior with two coats of this paint, made of gas-tar, two gallons and gasoline, one, mixed thoroughly to make an emulsion, which it will readily do after about three minutes' agitation. It can be applied better than hot gas tar, "strikes in" better, and dries as soon or sooner, and then there is no trouble with boiling tar, ignition, etc.

In my new silos I dispensed with all masonry, and, so far as I can see, they are better than any one in which there is a joining of stone and timber can be. A trench 12 inches wide and nine deep was dug the exact size of the silo, a two-inch tile was put in the bottom in a depression for it, and then 12-inch-square sills, thoroughly painted with gas-tar, especially at the ends, and half lapped at the ends were put into this trench, and thoroughly tamped at the sides so that they are as "solid as a rock." The studding was then nailed to these sills tar was applied up three feet, the three courses of bottom boards also received the same treatment. There is no floor in the silo, save the natural earth, which was drawn from the center of the pits to the walls, and thoroughly beaten down so as to make a gradual rise from the center to the walls, the earth coming up about eight inches above the sills. In building a single-thickness silo, the corners become quite important, and the boards should be put on as depicted at the Figure 292 running up four or more inches at each corner. When complete, take an inch-and-a-half square strip, take off one corner, and nail it into the corners of the silo, and paint it thickly with the tar, and you have an air-tight joint. Such a silo can be built in a barn for about 40 to 50 cents per ton capacity. In building a single-thickness silo, I would use a fair quality of matched flooring and see that all loose knots are cut out.

SHRINKAGE IN MILK.

W. E. R., Dover, N. H.—I have a Guernsey cow four years old. She went dry about a month and calved about three months ago. Two weeks after calving she was giving 16 quarts per day. She began to shrink in her milk, and I began feeding her five quarts per day of meal and bran in equal parts. She kept on shrinking and lately has given only six quarts per day. Her bag seems to be growing fleshy. Besides the grain, she has a good feed in the barn mornings and nights and runs in the pasture when the weather is pleasant. She gives her milk down slowly, but the milk is good, and a little more than seven quarts will make a pound of nice butter. Last year she was troubled in the same way. I was feeding cotton-seed meal then. I wrote to the R. N.-Y. for advice, and the question was answered by Henry Stewart and he said the trouble was caused by the cotton-seed meal. I stopped feeding cotton-seed and gave more corn-meal as he advised. I thought she milked a little better, but did not give any more milk. He said she was too valuable for beef. What does the R.-N.-Y. think now? Can anything be done for her or had I better fatten her for beef?

ANSWERED BY HENRY STEWART.

The effect of cotton-seed meal upon such high-milking cows as Guernseys and Jerseys, when fed even in small quantities, is to act upon the milk glands so as to stimulate their action in the production of milk and butter. It is frequently the case when highly stimulating food is given that the action is diverted from the production of milk, and injurious congestion, due to the increased circulation of blood, is produced. This causes tumefaction or hardness of the milk glands and the udder becomes hard or fleshy, and the glands no longer perform their office of milk-secretion. This seems to have occurred in this case and it is doubtful if any recovery will be made. If the cow continues to give a pound of butter a day she is certainly worth keeping, and it would be a pity to kill her for beef. When the cow has another calf she may probably be restored by judicious treatment. This should consist of a careful gradual drying up of the cow before calving; light feeding, without any grain at all for two months previous; a dose of one pound of Epsom salts a few days before the calf is expected; and very light feeding for a few days after it. Gentle rubbing and kneading of the udder are useful to cause absorption of the injurious matter, and restoration of the glands to healthful action, which under the circumstances is not by any means improbable. Hence there is good reason to avoid sacrificing a good cow. It will be wise, however, even now, to feed very moderately of grain, and to adhere to corn-meal only with bran given in the form of mash, and to keep the cow in a laxative condition.

PUMPING WATER FROM A DISTANCE.

W. H. W., Cranford, N. J.—I want to bring water from a surface spring to my barn. It's about 500 feet away, and six feet lower than my barn cellar. My plan is to dig a cistern in my feed room under my barn, say nine feet deep, and use a three-fourths-inch iron pipe for a syphon, placing one end in the spring and the other in the cistern. Is the plan practicable?

ANS.—The plan will not work, for the reason that the small fall will not give sufficient power to carry the water through 500 feet of pipe, and as you must have a pump to draw the water from the cistern you may as well attach it to the pipe at once and draw the water from the spring. The pipe should be laid sufficiently deep to escape the frost and have a check-valve at the end in the spring, and a good pump should be used. There will then be no trouble if the pump is worked properly, that is, with slow strokes and not sharp jerks, because in drawing the water the inertia of the long column of water is to be overcome. An air-chamber in the pipe below the pump as seen at Figure 293, would

Fig. 293.

equalize the flow of the water and make the delivery of it more easy.

WHITE CAPS IN BUTTER.

C. W. S., Parishville, N. Y.—What are "white caps" in butter and butter-milk? How can their appearance be prevented when the milk is set in open shallow pans where a fire is needed to secure the proper temperature?

ANS.—"White caps" are particles of caseine or albumen, or perhaps both, that are solidified in the sour cream by the warmth. This is a common cause of complaint at this season when milk is set in shallow pans, and the cream is warmed to prepare it for the churn by setting the cream in the churn. The usual methods of warming cream for the churn by setting the cream jar in hot water or near a stove for a few hours, will invariably cause the caseine or albumen to become solid at the edge of the jar as the warmth is not readily distributed through the mass of cream and a temperature of 80 degrees is sufficient to harden the flakes. The only remedy is to skim the milk before it is sour and to keep the cream constantly at a temperature of 62 to 65 degrees and so avoid the necessity for warming it in the usual way. We suspect this to be the cause of the trouble, not being informed as to the method practiced in this case. In cases where the writer has purposely experimented to produce these white flakes or specks in the butter, the method above mentioned was used, and it was always effective. But it was found quite easy to work the butter so as to incorporate the flakes with it when they were not too hard, and this was done without any detriment that could be detected to the butter, when the latter was used immediately; but butter made in this way will not keep. As a remedy for the precipitation of the flakes, the mixture of a table-spoonful of a solution of carbonate of soda with an eight-quart pan of milk was found effective in preventing the excessive acidity which was the cause of the trouble, even when the cream was warmed by setting the jar in water of a temperature of 100 degrees; the cream being gently stirred at intervals of 15 minutes, with special care to clear it from the sides of the jar.

HEAVES.

W. T. H., Worcester, Mass.—My horse is troubled somewhat with the heaves, especially after he has been driven. What would be the best diet for him and would it do any harm to give him carrots and how many at a time? How much corn and hay should he have?

ANS.—The subject of heaves was exhaustively treated on page 767 of the R. N.-Y. for 1886, and questions in relation thereto were also answered on page 397 of the present volume. Feed nothing dusty. Bright, clean hay will do; but if in the least dusty it must be sprinkled with water. Cut straw or hay, wet with water and mixed with ground feed is excellent. Carrots are one of the best of feeds. A peck is about the right quantity for an ordinary horse, twice a day, beginning perhaps with less. Do not allow the animal to gorge himself with hay, but give him what he will eat up readily without leaving any. Water frequently, feed regularly, exercise daily, protect from cold winds and storms, and you have done as much as any medicines can do to keep the disease from manifesting itself. Heaves are incurable, but proper treatment will keep them from being troublesome.

"POINTS" OF THE HOUDANS.

J. P. V., Seney, Iowa.—What are points and color of Houdan fowls.

ANS.—The American Standard of Excellence says that Houdans must have black and white feathers intermixed, the more evenly the better. Red or brassy feathers disqualify in the show-room. Many breeds do not show their best markings until after moulting. Most pure-bred birds will throw some chicks which are off color, so we should hesitate to say yours were not pure-bred. They should have five toes. The scale of points is for symmetry, 10; size and weight, 10; condition eight; head four; crest and beard, 18; comb, seven; ear-lobes and wattles, five; neck, five; back, six; breast and body, seven; wings, six; tail, seven; legs and toes, seven: total, 100.

KILLING SMUT.

E. L. H., Holly, Mich.—Is there any way to kill smut in oats before sowing them?

ANS.—From experiments made at the New York Experiment Station it was decided that smut was prevented by soaking the oats in a solution of four ounces of sulphate of copper in one gallon of water or half an ounce of caustic potash in six gills of water. Soak in the first about 30 hours and in the second 20 hours.

Miscellaneous.

Subscriber, Edgecomb County, N. C.—Who has Angora goats? What are they worth?

ANS.—Miller & Sibley, Franklin, Verango County, Pa., have some excellent animals. Write to them for prices.

F. M., Naples, N. Y.—I would like to subscribe for a good paper, published in the Hudson River Valley, say in Ulster County, which tells a good deal of fruit, and the condition of the vineyards, as well as of the ripening and shipping of grapes in the Hudson River Valley.

ANS.—We do not know of any such paper. The Orange County Farmer, Port Jervis, N. Y. comes nearest to it.

W. T. L. Ten B., Rhinebeck, N. Y.—Is there any agricultural college in which a person can go through an agricultural course getting work enough at the college to pay for board and tuition.

ANS.—We do not know of any institution where one can get work enough to pay for his board while taking the college course, but at the Michigan College at least half the board can be paid in this way while tuition is free.

J. L., Chicago, Ill.—I saw an item in an agricultural paper, which said that the best way to grow turnips is to sow the seed in the corn just as the field is plowed for the last time, or as the corn is "laid by." Has the R. N.-Y. tried the plan?

ANS.—The R. N.-Y. has frequently heard of this method of sowing turnips, but has not tried it. A neighbor sowed turnip seed among the potatoes at the last cultivation and made a good crop. The squashes should do as well as the pumpkins.

K. N., Hurlock, Md.—My farm is a sandy loam considerably run down, and very deficient in humus. Would it be advisable for me to use sawdust for bedding and in my compost heap, with the expectation that it will add humus, and perhaps a little fertility.

ANS.—Yes, we should use all the sawdust that we could reasonably obtain. Use all you can in the stable behind the cattle and mix it well in with the manure. It will not give the quick returns that would be felt from the use of straw or green manure, but it will help your light soil.

Discussion.

THE COST OF FARM LIFE.

J. VAN L., LA CROSSE, WIS.—For the past four years—from 1885 to 1888 inclusive—I have kept an account of our family expenses.

The yearly cost of meats, groceries, kerosene, provisions and wood.	No. of adults.	Cost for each	Yearly cost of wearing apparel including boots and shoes.	No. of adults.	Cost for each adult
1885, $198.02.	7.	$28.29	$145..	6.	24.20
1886. 162.22.	6.	27.03.	175.88.	6.	29.31.
1887. 260.57.	7.	37.22.	164.07.	6.	27.34.
1888. 269.10.	7.	38.44.	172.27.	7.	28.71.

During those four years we expended for furniture, papers, schools and music $98.64. The above table does not include fruits, vegetables, butter, milk, cream, fowls and eggs all of which were raised on the farm. If all these had to be bought, the expenses of living would naturally be considerably increased. Timber for fire-wood grows on

the place, but the yearly expense of cutting and hauling it ($40) is included in the table of expenses. If wood had to be purchased it would add $10 to the yearly cost, for all that is used for fuel can be bought here as standing timber very cheap. Clothes are bought partially ready made, and a good proportion of them are made by the women folks at home. No separate account has been kept as to the cost of boots and shoes, as this is included in the outlay for wearing apparel.

L. H., DANSVILLE, N. Y.—The following table shows the number of persons in my family and the principal items of expenditure for living expenses during five years.

	Number of adults.	Number of children	Equivalent No. adults.	Yearly cost of groceries.	Cost for each adult.	Value of wheat used for flour.
1875.	4½.	0.	4½.	$45.42.	$10.09.	$32.40
1878.	4.	0.	4.	43.92.	10.98.	22.10
1881.	4.	1.	4½.	57.26.	12.72.	34.10
1884.	4.	2.	5.	57.42.	11 58.	25.20
1888.	4½.	2.	6.	65.71.	10.95.	38.80

My books do not show the separate items of sugar and molasses, but they are included with the tea and coffee (no tobacco) under the head of "groceries." No account was kept of fruit and vegetables, as they were raised on the farm, and it was difficult to keep an account of the amount used. The price of wheat used for flour ranged from 90 cents to $1.30 per bushel.

J. H. G., QUEENS COUNTY, LONG ISLAND.—The question of family expenses is a delicate one. If the figures are low the wife will take them to her husband and show him how very economically she is managing the family. If, on the other hand, they are high the husband is sure to say to his wife: "I told you so; we are living too extravagantly. It must be stopped." In either case it is not likely that there will be any natural change in the method of living. The fact is family expenses cannot be measured as one would measure a gallon of molasses or a bushel of potatoes. A small amount of expense may not indicate judicious economy, neither would a large expenditure necessarily indicate unwise extravagance. It is not the money we expend, but what we expend it for—the manner in which we expend it—that determines the character of our living. When we have learned that money is not the end, but only the means to an end, we are in a condition to live as we ought to live. In the average estimate of family expenses I notice that the unknown quantity used off the farm is estimated roughly or omitted entirely. This makes the whole estimate incomplete and unreliable. In my own case I have lived in the country, owned my own house and bought everything needed for a family of three persons, and about the average amount of company. My expenses have been as follows:

Fuel—five tons coal	$30.00
" wood, kindling	5.00
Flour—two barrels	12.00
Meat	100.00
Potatoes—two barrels	5.00
Vegetables, celery, etc	20.00
Sugar	15.00
Coffee	6.00
Tea	3.00
Butter	15.00
Milk	21.60
Canned goods	4.00
Spices, etc	10.00
Fish	13.00
Eggs—50 dozen	12.50
Clothes	100.00
Washing—hired labor	26.00
Shoes	30.00
	$428.10

In the matter of fuel I have a furnace and a range. I find that they do not require more than two-thirds of the fuel required for stoves, and there is an immense saving in labor. I buy my meat in the city at the following prices:

Beef—sirloin steak	14 to 16 cents
" roasting piece	10 cents
" soup "	5 to 6 cents
Mutton chops	14 cents
" roast	10 to 14 cents
Pork steaks	12 cents
" sausage	10 cents

Milk I pay six cents a quart for. Clothes and shoes are bought ready-made in the city. I find that it pays to pay cash for everything, and buy direct from the producer as far as possible. I should say that there is at least 40 per cent. difference between the top "retail" price and the lowest price of food of the same quality produced direct from the producers or in the open markets. In common with almost every one else in these days of extravagant living, my chief expenses are for the luxuries—not for the necessaries of life. For example, my car fares were more than my meat bill. On the whole, I am inclined to think that the incidental expenses are greater than those which might perhaps be called essential and this is, I think, true of almost every family who live in the modern fashion. It is doctors' bills, carriage hire—or what is the same thing "carriage use"—railroad fares, concerts, theaters, etc., rather than our meat and clothing bills which eat up our incomes.

FAST-WALKING HORSES AGAIN.

H. S. W., LITTLE UTICA, N. Y.—After reading under the head of Discussion, in the R. N.-Y. of November 16, the item by R. C. F. relating to fast-walking horses, I feel impelled to write something in criticism of what he says in that article. Now, I, for one, would feel positive, without reading even a quarter as many agricultural papers as R. C. F. tells us he reads, that a good, active, smart walking horse, is the great desideratum for the general run of farmers. Perhaps it may not matter so much to the farmer (?) who spends a good share of his time driving a fancy horse on the road or talking politics in the corner grocery, whether his work-team and plow and hired man at home are walking at the rate of two miles or only one per hour. The farmers I have in mind (and their name is legion) are those who keep only two, possibly, three horses, which are used for all farm purposes and for driving on the road. For such men fast-walking horses are the kind every time. For instance, let a live, energetic man accustomed to using a good walking team, start for town behind a pair of slow-walking horses and his mental sensations will very soon tell him which kind he prefers. I, for one, would not buy a horse, however good he might otherwise be, if he possessed the fault of being a slow walker. Here at home we are of the kind who do our plowing and team work generally, and I know that a good, fast-walking business horse (not one of the highty-tighty fast-walking fly-aways) that will draw a load or an empty wagon on the road so that it will not be necessary to take a "squirt" to make him move, will draw a plow in a perfectly satisfactory way, and the hired man will not suffer any bodily harm from following; neither will the horse's nerve desert him. Then, again, when we hitch our general-purpose horse to the buggy to drive either for pleasure or business, what is more aggravating than that slow, poking gait which makes the slow-walking horse a regular nuisance so far as travel is concerned.

Walking with many horses is a habit; in fact, it is so with all horses to a certain extent. Break and work a colt by the side of a good, energetic horse and its habit of walking will be adapted more or less to the gait of the older horse. And very often a pair of horses that might have made a fast-walking team, are ruined in that respect, all because their driver is a laggard himself. In conclusion, let me say to farmers in general: when you are purchasing a team for general purposes, search for horses that are good, smart walkers, and after using them for one week, I will warrant you will never want any other kind.

THE MILK PROBLEM.

J. J. M., WHIPPANY, N. J.—There seems to be a move on the part of the milk-producers of the country sending milk to New York City to get out of the grip of the New York Milk Exchange, and from what I know at present about that movement they are putting themselves in shape to accomplish it, and until they do that and do it effectually, they—the farmers—will never get paying prices for their milk. If I understand the matter, the Milk Exchange is composed of about 100 milk-dealers, mostly of New York City. They meet once a month and "fix"—as they call it—the prices to be paid for milk the following month. The prices of grain feed or hay or cows or the cost of labor to produce the milk make no difference to them. They say: "That is the price; take it or keep your milk at home or do what you can with it. We will not pay any more for it." The farmers have stood this long enough. The time has now come to move, and to do it in such a way that the farmers can obtain control of the prices themselves.

Look at the prices paid for milk to the producers at their shipping points for the last 20 years, and what do you find? A gradual shrinkage in prices amounting to 26 per cent.; that is to say, the prices to the producers have gradually been forced down until there is no money for them in the business. How about the consumers? How much less are they paying for their milk than they did 10 or 20 years ago? Not anything less to speak of. Now does it cost so much more to handle this milk and get it from the producer to the consumer than it formerly did? Not by any means. Then where does the money go? I will let the question answer itself. Any fair-minded man will see where it goes. I contend that the producers now have a chance to change this entire business and they must do it to protect themselves, for the consumers will pay no more than they are now doing. Let matters go on in the present way 10 years longer and where will the producers land? I cannot tell.

THE DRYING OFF OF COWS.

C. E. E., AVOCA, N. Y.—With regard to the drying off of cows, my chief object is to keep them up to a full flow of milk as long as it can possibly be done with profit, and then to dry them off as quickly as practicable. I generally milk my cows until about January 1, and aim to have them fresh about the first of March, allowing them to go dry for two months; but I find that among animals of the same breed it is next to impossible to keep some to their milk; while it is almost impracticable to make others dry up in the fall and early winter. I feed corn-fodder, mangel-wurzel, pumpkins, and such provender, saving small and diseased potatoes to be fed a few weeks before calving. I consider the latter very valuable feed at that time. From the time when I begin to dry off the cows until a short time before they calve their principal feed is straw. I would not feed this were it not that the animals are in a warm location where they are protected from cold winds. When drying off I milk the cows a few times once a day and then cease to milk them for a long time, being sure that they are dry when milked the last time. I always try to keep a heifer to her milk very late, thinking that perhaps it may make a difference afterwards. A few years since one of my cows that I supposed was farrow, proved to be with calf and it was so late when that conclusion was arrived at that she could not be dried off. The calf was so poor and weak that I did not try to raise it. Another time I bought a cow expecting to milk her during the winter and fatten her for beef in the spring. Towards spring I discovered that she was not farrow. The calf was nothing but a mere framework with a hide over it. This cow was fed high for milk and beef. From my experience I conclude that the closer a cow is milked up to the time of calving or the more she is forced to give a large quantity of milk, the greater will be the injury done to the calf, but I have never noticed any injury to the cow. I keep from eight to 12 cows and sell the butter to special customers at fancy prices.

BUDDED TREES IN THE WEST.

PROF. J. L. BUDD, AMES, IOWA.—A correspondent writing from Brighton, N. Y., says: "I inclose copy of a circular which is being sent abroad in some sections: I send it to you because it evidently misconstrues or misrepresents an article by you to which reference is made. Why *budded* trees should be a swindle, I am at a loss to know. Do you not think a thing of that kind misleads the public, and really does as much harm as the evils it seeks to correct?"

The circular referred to is sent by a well-known nurseryman of Illinois, who denounces the budded trees as arrant humbugs and quotes the writer in support of his views. I reply in the R. N.-Y., as a general denunciation of budded trees was never intended by me in the article to which reference is made. Over large areas of the Eastern and Southern States budded trees of the apple and other orchard fruits are as good as, or better than root-grafted ones, but the fact remains that west of Lake Michigan the drift soils are relatively loose and friable, and our most trying winters are often without snow; hence the hardiest varieties on common commercial stocks are liable to be root-killed. Of course, they might be saved by very deep planting on dry soil; but the average planter is not aware of this need. Even when root-grafted by using a long cion and a very short root, we sometimes lose tens of thousands of hardy apple trees in the nursery if they are not deeply banked in the fall; but where properly grafted and set, a large part of our nursery trees have thrown out roots from the cions before they reached the size which planters require.

CROSS-FERTILIZATION OF GRAPES.

G. R. W., LYNDON, KY.—Reading the article about the Colorado Grape in a recent issue of the R. N.-Y., calls to my mind a few questions I would like to have answered by some of the leading pomologists. J. G., says, that having a Brighton and Chasselas growing on the arbor opposite each other these two vines interlocked their branches on top of the arbor, and while in bloom the bees were very busy, etc., etc. By all this I understand that he wishes to say that the bees fertilized one vine with pollen from the other. Now my questions are: 1. Is it possible for the bees to fertilize a grape blossom? 2. Has any one seen bees so at work as to warrant the belief that they were fertilizing the grape flowers? I have many thousands of bees and several acres of grapes, and after careful observation I am certain that I have never yet seen them at work on the blossoms. If any one will study the nature of the grape blossom, he will see that it differs from other fruit blossoms: the way the blossoms open forbids accidental fertilization; for as soon as the caps burst off, the pollen falls on the pistils and the grape is fertilized. I don't believe there is one chance in a thousand for a grape to cross with another without the help of man. There is but one way to fertilize the grape, and that is, to collect the pollen of one vine and watch one's chance to place it in the blossoms of the other vine as they open. Let us hear what others have to say.

FEEDING FOR BUTTER.

E. J. M., SHELBYVILLE, ILL.—For making butter I feed for winter rations oat-meal and corn-meal, equal parts. I find this to be as perfect a ration as I can get for producing a good quantity and quality of butter. I feed green-cut clover hay and some oats, and straw for "roughness." For a summer ration when the cows are on good grass I feed about equal parts of oat and corn-meal and wheat bran. I would not advise feeding much corn-meal when the animals are on good grass, as, in my opinion, it is likely to produce too much fat. I use high-grade Short-horn cows that have been bred for butter purposes. I have been crossing some of them with thoroughbred Jersey bulls the past year.

J. P., WAWA, PA.—The answer to an inquiry about the influence of walnut trees on fruit trees growing near them, in a late issue of the R. N.-Y., might lead some one to plant apple trees near a walnut tree. Such planting, about 1845, has resulted in the death of 12 trees, not one surviving within 75 feet of the walnut tree, while the rest of the orchard is in thriving condition. I also wish to notice some advice given in the R. N.-Y. some months since where the suckers or root sprouts of the pear were said to be suitable for grafts for the pear. I have an orchard that was grafted to some extent on such stock. The roots are of course of the same character and continue to throw up suckers certainly to the great injury of the orchard. I think such stock should not be used.

What Others Say

UP AND DOWN.—Our respected contemporary, the Journal of Commerce, speaks wise, effective words, under this head:

The path of life has been described by an old writer as an uneven way. Now it is an upward stretch, difficult of ascent, but rewarding those who climb with the invigorating atmosphere and the glorious views from the summit; and anon a downward turn with a slippery surface, until it reaches a gloomy ravine, into which the sunlight can enter only for a brief period at noon-day, and which is full of depressing vapors and noxious odors. But in one sense the ups and downs of life are almost wholly in the mental condition of those who are on the journey, and for this condition the pilgrims themselves are largely responsible. There are thousands who mourn over this bitter experience, and many who rebel against it, and fill the air with their murmuring cries, who might walk in the sunshine if they would so elect.

This is not mere theory, a poetic vision with no substantial basis, but a plain practical matter of fact, to be taken into the every-day experience. A great share of the burdens of life are the offspring of the imagination. The "ills that never happened" are the authors of the greatest portion of human wretchedness. Looking downward is the looking for evil, and the path to every one who bends his gaze wholly earthward, goes down straight into the gulch, out of

the reach of most of the sunlight. The upward look is the look of faith and trust. It does not anticipate any coming woe, and a large share of the sorrows that fill the eye and bring on the heartache are thus removed at a single sweep of the upturned vision.

What a difference there is in homes! The farmer returns from his work at night bringing with him only a record of the day's trials and disappointments. The good wife has also had her troubles and they pile them together on the table at the evening meal, or in front of the hearthstone. They dream about them all night. In their visions they are falling off precipices and sinking into deep ravines. They rise in the morning unrefreshed and go to their several duties clothed in sable, with the furrowing wrinkles sinking deeper each day into their tell-tale cheeks. They are looking downward with their eyes and thoughts full only of the roadway, its difficulties and impediments. Here is another pilgrim who has had as many struggles and crosses as the former, but he, like him, has had successes and deliverances too, and it is the brighter side of the record he has hid in his heart and brought to his home His wife has had a toilsome day, perhaps; the children have worried her, and many things have gone wrong; but when the husband appears with his sunny face the load somehow seems lifted from her aching heart. He is such a tower of strength to her weak frame and quivering nerves, and she soon adds her smile to the brightening hours. And the children, if there are any, how their ringing laugh catches a gayer tone from father's cheerful spirit. His day's experience has been perhaps a sharp conflict in the battle of life, but he has fought with an upward eye which doubles the joy of every victory and takes the sting from each defeat. The pilgrim in any part of life's journey, who can truly say with the poet: "Upward I turn mine eye," has a never-failing source of strength and hope.

RURAL LIFE NOTES.

PROF. BAILEY'S (Cornell University Experiment Station) experiments are always of a practical nature and described in plain language. A late bulletin is devoted to tomatoes. Prof. Bailey finds that both early fruiting and abundant fruiting are promoted by early sowing provided the plants are properly treated. They must be stocky plants and these cannot be produced without sufficient space to grow in, plenty of light and several transplantings. A record of his experiments fully shows this in every case. The gain in the earliness of fruiting (March 21) sometimes amounted to three weeks. The disadvantage of late planting (May 15) is particularly pronounced, especially in point of productiveness.....

IT has been the R. N.-Y.'s experience, as recorded from time to time in these pages, that rich soil is conducive to rampant vines, to unproductiveness and to late maturity. Prof. Bailey's experiments give very different results. He planted on three plots. The first received 5,460 pounds of fine, old stable manure. It was 60 by 30 feet. The second received nitrate of soda, eight pounds to 55 by 30 feet; and the last, of the same size, had received no fertilizer or manure of any kind. The rich surface soil had, moreover, been removed. The three plots were treated alike in all ways. From the first there was a great difference in the appearance of the different areas. The plants on the heavily manured plat were uniformly most vigorous and largest. The nitrate-of-soda plantation gave stocky plants of medium size with a very dark color of foliage. The unfertilized plat gave small plants with a light cast to the foliage.....

THE first ripe fruits were found on plat III.; but there were only two on the whole patch which ripened in advance of plat I. and the difference amounted to but a day. At the first picking, plat I. produced by far the most fruits, and they were in every way superior to those from the other plats. During the whole season plat I. continued to hold its superiority. In point of earliness plats II. and III. were about the same.

On October 10th the average total yield *per plant* was as follows:

Plat I. heavily manured, 12.7 pounds.
" II. nitrate of soda, 9.1 pounds.
" III. no fertilizer, 6.8 pounds

THE Rural Grounds and an acre field near them would have shown a very different state of things during the past season and, indeed, in previous years. The acre was poor soil feebly manured with less than 10 tons of farm manure to the acre. The plants began to ripen their fruit at least 10 days earlier than a small experiment plot of the R. N.-Y. containing some 100 plants. These had received both stable manure and fertilizer in liberal quantity. We cannot say positively whether the average quantity per plant was more or less. A general impression is that the poor field yielded more than the rich plot and that fewer green tomatoes were destroyed by frost....

TO SHOW how the same tomato will vary in different soils and under different treatment let us compare a few of Prof. Bailey's reports with our own. He says that the Haines (No. 64 from Northrup, Braslan and Goodwin) is too irregular. We found it fully as regular as Ignotum. Prof. Bailey considers that "regularity of shape" is one of its" particular points of superiority." In other respects the two reports agree.

Our report of the Shah (Henderson) and Prof. Bailey's are alike. It has no value. The fact of its being the first yellow with potato-leaf foliage is simply worthy of note. Our own tomatoes, however, were not all yellow. Some were reddish, others orange color.

Lorillard (Henderson) at the Rural Grounds was not only very regular and productive, but there seemed no reason for designating it as not valuable as a market variety, as Prof. Bailey does.

Mc Cullom's Hybrid with him was a "second early." With the R. N.-Y. it was late. Bay State (Bragg) was also late and of no notable value. Prof. B. estimates it as "one of the best recent introductions."

As to Prelude, both reports agree. The tomatoes are rather small, but regular in shape, very early and productive..... ...

PROF. BAILEY, says of the Ignotum, which originated with him while at the Michigan Agricultural College, that it is without question by far the finest market tomato which he has ever grown. Its particular points of superiority are large size, regularity of shape, solidity, productiveness, and uniformity throughout the season. It is the largest and heaviest of the perfectly regular tomatoes, and the most solid of any of the market sorts. The pickings from his patches this year were usually fit for market as they came from the vines; and the last picking, October 10th, after a long season, was scarcely inferior to the best picking of the season.....

As grown with us it was not particularly regular. It occurred to the writer, and a note appeared to that effect in these columns in early fall, that it should be grown from selected seed a season or so longer before introduction. As to solidity, fruitfulness, etc., the R. N.-Y. fully agrees with Prof. Bailey's report..... .....

HAS Prof. Bailey had occasion to notice (we address the inquiry to him as having given the tomato more study than others) that the color of tomatoes differs under peculiar conditions? Last year the R. N.-Y. raised about 20 different kinds in a very poor soil. Potato chemical fertilizer was liberally used, and that alone. The color inclined to a yellowish orange in all alike.

DAIRYMEN, says the Breeder's Gazette, are coming to place a high value on oats, and this year they will be used extensively on many farms in place of bran. For making solid, healthful flesh and strong bone, and giving to the animal great vigor and quality, no grain on our farms can equal the oat.....

PROF. SHELTON of the Kansas Agricultural College, speaks in the highest terms of kohl-rabi as a drought-resisting succulent crop for the West. He recalls, in the above journal, the season of 1887 as one of drought and disaster. Every grain crop upon the college farm was nearly a complete failure. Late in October he harvested from about half an acre, 205 bushels of handsome bulbs, to say nothing of several wagon-loads of tops which, without weighing, were hauled to the cattle and greedily consumed by them.....

THE past season kohl-rabi was cultivated on two detached pieces of ground aggregating something like one acre. The smaller of these (36 .00 acre) was harvested a few weeks ago. It gave 273 bushels (60 pounds) of bulbs, a yield which rates at 758 bushels or 22 79-100 tons per acre. The bulbs ran from six to 12 pounds each, although a single specimen three weeks before harvesting weighed an even 20 pounds.....

THOSE intending to cultivate kohl-rabi are advised to select clean, rich ground and to plant at ordinary corn-planting time and keep clean. While Prof. Shelton cannot guarantee a crop of bulbs in every case he is confident that with no other Western farm crop are the chances for success greater than with kohl-rabi. Of the two kinds, purple and green, sold in the market for stock purposes, the purple is greatly the better, giving larger and handsomer bulbs apparently of better quality than the "white," the name under which the seed of the green variety is commonly sold. In seeding avoid the hand drill; it always wastes two-thirds of the seed that it sows and does its work poorly. He plants by hand preferably and thereby saves seed sufficient to pay the laborer, and gets a better stand than can be had with the drill. Two to four seeds thrust into the moist earth by the thumb and fore-finger, at intervals of 10 to 12 inches, are almost certain to give an even stand in the best possible shape for the subsequent operations of thinning and hoeing.....

A NEW method of dressing chickens for market is given by a correspondent of the Massachusetts Ploughman.

The chicken is either beheaded or knifed in the throat in the ordinary way, and is instantly immersed in a tub of cold water and held there until it has ceased to kick, when it is immediately taken out and the feathers will come out by the handful, as easily as if scalded. Care must be taken to hold the chickens long enough, but not too long in the water, and remove the feathers immediately. The skin is not torn or disfigured in any way, and the dressed bird presents a particularly attractive appearance. This was done with spring chickens of about four pounds' weight. It required not over five minutes to kill and dress a bird in this way.....

THE WESTERN AGRICUTURIST says that Holstein-Friesians outnumber all the other breeds of cattle at leading Western State fairs this season. This shows the increasing interest in dairy production. The strong point with the Red Polled and Swiss cattle is that they are good dairy cattle as well as good beef animals, and the best milking families of the Short-horns are increasing in popularity in this country and Europe. Still, the beef-producer will ignore milk as of little consequence. Meanwhile the dairy cattle are increasing in popularity the world over.....

THE excellent Iowa Homestead says: "Every day we see long lines of wagons loaded with fine potatoes standing in the streets of Des Moines for which the farmers ask 20 cents per bushel, retail. Carloads can be bought at 15 cents and under. Eastern consumers need not fear any scarcity of potatoes. Western farmers would be only too glad to get 25 cents per bushel."

Yes, that is true as we know from our Western subscribers and contributors. But how much does it cost to get a barrel of potatoes from Iowa to New York?.....

LUTHER BURBANK, of Santa Rosa, Cal., is doing some valuable work in the way of producing new varieties of fruits and flowers by crossing. The American Florist says that he has 10,000 new varieties of potatoes; that he has grown over 100,000 roses from seed, 25,000 of which are retained. He is the originator of the Burbank Potato....

A GOOSEBERRY is described in the Canadian Horticulturist as twice as large as the Downing and utterly free from mildew. It is wonderfully prolific. It is a cross, by Prof. Wm. Saunders, between Houghton and Whitesmith.....

PROF. J. L. BUDD, in the Canadian Horticulturist, speaks, as the R. N.-Y. is impressed, a well-deserved word of praise for the Simon's Plum. Our own specimen is the only plum ever raised at the Rural Grounds that did not seem to sustain injury from the curculio. The flesh is very firm. Prof. Budd thinks, when better known, it will be valued for canning or stewing, as it has the peach flavor without the peach bitter.....

Hood's Sarsaparilla 100 Doses One Dollar

It is Economy to buy Hood's Sarsaparilla, because it is the only medicine of which can truly be said: "100 Doses, One Dollar." It possesses peculiar strength and curative power, and effects cures where other preparations fail. Try it, and you will realize its merit. Sold by all druggists. Be sure to get Hood's Sarsaparilla.

NOTHING ON EARTH WILL MAKE HENS LAY LIKE SHERIDAN'S CONDITION POWDER

Highly concentrated. Dose small. In quantity costs less than one-tenth cent a day per hen. Prevents and cures all diseases. If you can't get it, we send by mail post-paid, One pack. 25c. Five $1. 2 1-4 lb. can $1.20; 5 cans $5. Express paid. Testimonials free. Send stamps or cash. Farmers' Poultry Guide (price 10c. free with $1.00 orders or more. I. S. JOHNSON & CO., Boston, Mass.

SATURDAY, DECEMBER 7, 1889.

NOTICE.

THE entries for the "Notes on a Back Number" prize will close December 15.

ALL who have new and promising varieties of potatoes for sale, should announce them in the R. N.-Y. Potato Special to appear in a couple of weeks.

"AFTER tryng to exhaust my soil for 30 years, the bulk of the fertility is still there." Sir J. B. Lawes, page 804.

"WHAT is the use, my friends, of pulling away at the horns and tail while some one else quietly gets the milk?" T. B. Terry, page 804.

A cow with good teeth will make short work of an ear of dent corn. Cob, grain and all quickly disappear. Horses nibble off the grain and leave the cob, but some cows seem to like the taste of the cob. Cobs of dent varieties please our cow more than do the hard, flint varieties. We know of farmers who feed their corn without husking it at all. The cows eat the ears, husk, cob and all. With the softer varieties the grain is about all eaten up, but with flint corn, the older cows have a hard time. The best you can make of it, it is a curious sight to see a cow handle a big ear of corn.

THE FARMERS' ALLIANCE claims a membership of 2,500,000, and the Knights say they have a paying membership of 250,000. A confederation would therefore give 2,750,000 votes. Of this vast constituency the farmers would of course be the body; the workingmen the tail. Would the tail wag the body or *vice versa*? The union would of course be mainly for political purposes, as on the questions of wages, strikes, hours of work, etc., the two orders could not well agree. Even on the single-tax question the farmers and the operatives, as represented by the recent conventions of the Grangers and the Knights, are diametrically opposed. The Grangers strongly opposed such a measure; while the Knights emphatically approved of it. The political papers have had a great deal to say editorially during the past week about the projected union, and of course, most of them disapprove of it.

AS USUAL, the Thanksgiving market was flooded with poultry. While prime, fresh stock always sells for good prices at this time, poor lots, or those arriving in a damaged condition must be sold for what they will bring. The weather has been the worst possible for handling dressed poultry, being warm and wet, and many lots of dry-packed were so sour upon arrival that it was almost impossible to sell them at any price. The R. N.-Y. has constantly advised its readers to sell their poultry, especially fowls and chickens, before the markets become so glutted and prices so depreciated. Tons of chickens were sold in this market the past week for less money than the same birds would have brought three months ago. Does this pay? Chickens sold as low as five cents per pound! From now until after the holiday markets, it will not pay to ship anything but choice poultry to this city. Fancy turkeys and ducks especially, are wanted.

THE charters of over 250 Missouri corporations which are charged with being members of some trust, pool or combination contrary to the provisions of the Anti-Trust Law, have just been revoked. Some of them are among the largest business concerns in the State, and it is probable that no small amount of trouble and inconvenience will be caused before the vexed question of the constitutionality of the law will be settled. Some say they will not obey the law now because they know that in the future it will be declared invalid by the courts. Various other excuses are given by others for their proposed disobedience. The big fight, however, will come between the State and the large corporations which admit they are in the trusts and combinations, but claim that they have a legal right to be in them. The opposition to the law among the members of the illegal combinations is strong and bitter, and neither money nor pains will be spared to defeat it before the courts. The people of the country at large will watch with no small interest the course of the war between the State and the monopolies.

CANNED MILK.

UNTIL within a short time the stewards on the large ocean steamers have used condensed milk almost exclusively. We are now told that many are using Norwegian canned milk, which has the merit of being all ready for use as well as being without change of form, and preserving the mixture of butter fats almost exactly as the product came from the cow. This Norwegian milk is prepared by a patent process which is so simple that it is quite surprising that it ever could be patented or that it was not made use of long ago. The milk is heated to 110 degrees, then cooled to 50 degrees, then heated to 110 degrees again, and again cooled, then heated to about 100 degrees and at once placed in tin cans and perfectly sealed. After being treated in this way, it is said to keep perfectly for months in the cans, or even for several days after being taken from them. Cream taken from this canned milk makes excellent butter. It is confidently expected that the canned milk will be offered for sale at all grocery and provision stores in England within a few years. Why not in this country? The process is said to be the result of efforts made by a dairyman in Norway to provide a profitable use for surplus milk at milk factories. We have an abundance of surplus milk in this country. Why can we not have experiments made to test the value of this patent here? This is a good chance for our experiment stations to show their interest in practical dairy matters.

"ABANDONED."

THIS title is being written on hundreds of good farms in the New England States. Many of these farms are as productive as they were 30 years ago when they supported large families comfortably and happily. Right by the side of the abandoned farms the R. N.-Y. has subscribers who are actually making money at farming. Why then is this sad and disheartening title written over these farms? Page after page has been printed in reply to this question, yet the bottom of it has not yet been reached. Western competition, unjust tariff laws, high prices for farm hands, overproduction, increased cost of living; all these reasons are practically answered by the thoughtful and enterprising farmers who make farming pay right in these "abandoned" districts. Does any one doubt that there are such men? "The old folks have died off while the younger people have gone to the cities." This statement by A. B. Deering on page 804, states the fact of the matter. Find the reason why the younger people prefer city life to New England farm life and you find the reason for the abandonment of these farms. Some of the younger people *do* stay and work the farms when the old folks retire. Find the difference between the home lives of those who stay and of those who go away and you learn another part of the secret.

There are many things that might be truthfully said about the causes that have led to the decadence in New England farming. If we could live the past 50 years of our history over again, it might be that New England farmers would have changed the policy of our government in several lines. Has the immense immigration from Europe which we have encouraged for years been of unmixed benefit? We have prohibited the importation of the products of cheap labor but we have brought over the cheap labor itself. We have given away the soil that Nature designed for the next century's food-raising and used this very gift as a club to drive our own citizens away from their homesteads. Free land, cheap labor, a horde of middlemen and handlers! Again, our wonderful railroad systems! Suppose they were less wonderful. Suppose it was less easy to transport a carload of corn or a carload of butter from Iowa or Nebraska to Boston. Would the Vermont or New Hampshire farmer be better off, better able to keep his "younger people" at home? And on the other hand would the Iowa farmer be so much worse off that his profit would be changed to loss? But these thoughts are of no material consequence now. We have given away our lands; our grain and meat would feed the world, our railroads are the marvel of the century. We have turned the old conditions upside down. Those who have deserted these Eastern farms and those who are now ready to desert have not been able to adapt themselves to new and strange conditions. You can't farm in New England as you did 20 years ago and make much of a living. That seems settled. You *can* farm there in a way that will pay a good profit. How is it to be done? The R. N.-Y. proposes to let its correspondents tell for themselves.

CHEESE SYNDICATES.

CONSIDERABLE has been said of late about attempts of British capitalists to buy up the principal cheese factories in this country, and especially those in the northern and central cheese-producing sections of New York. C. B. Ryan, of Ingersoll, Canada, an avowed agent of the combination, claims to have secured options on over 300 factories in that region, and a large cheese firm in Lowville, Lewis County, has also been getting options on factories in that neighborhood, but denies that it is acting for foreign capitalists. Rumors of similar negotiations likewise come from some other dairy districts in other States. Dairymen naturally ask what are likely to be the effects of such combinations. Will they, like others of a monopolistic tendency, seek to lower prices for producers and raise them for consumers? It seems to us that combinations for such a purpose would be impracticable. The first cost of a cheese factory is not large, while the patrons are not bound to send milk unless the price is satisfactory. The manager of a factory is frequently, if not generally, a hired hand who makes cheese for a mere trifle over the cost of making it at home. What therefore could prevent the starting of a new factory by farmers in any section in which they might think they were unjustly treated by the combination? Indeed, there would be a temptation to start such factories even where no charge of the kind could be justly made, in order to force the syndicate to buy them at a profit to the owners.

Another scheme of a somewhat different nature has been quietly progressing for some time and appears more likely to be realized. It is proposed to form an important syndicate, with a capital of $5,000,000, for the purpose of supplying the markets of Great Britain with the most acceptable kinds of American cheese at the lowest price consistent with a fair profit on the investment. Depots for the proper distribution and expeditious handling of stock after landing are to be established at various ports of the United Kingdom, and fully qualified and duly accredited buying agents, including two from London, two from Liverpool, and one each from Manchester, Bristol, Hull, Glasgow, Leith, Leeds and Birmingham, and probably other large consuming and distributing points also, are to act upon this side of the water. It is to be their duty to attend personally at the various Boards of Trade in the producing districts here and in Canada, picking out and purchasing the best grades of cheese suitable for the various markets they represent, and making direct shipments through the various ports on our seaboard.

Under the circumstances this would be the closest practicable approach to a direct deal between the producer and the foreign consumer, and it is believed that if the scheme is successfully carried out, a reasonable interest can be realized on the investment from the curtailment of the customary taxes by middlemen, while a fair margin of profit can be maintained for the producer at the same time that the average cost to the consumer may be reduced. It is also proposed to start a large depot in New York City to supply wholesale operators with all the cheese they may want for home consumption. However plausible such schemes may be in prospect, and however fair the promises of their projectors, there is always some danger that when they are in the full swing of success they will use their power for unjust self-aggrandizement at the cost of producers and consumers alike.

BREVITIES.

SOME of the best hog breeders in the country are going to tell us how they find a profit in feeding oats to hogs.

"UNEASY lies the head" of the farmer whose cows are shivering on the shady side of a straw stack these chilly nights.

AT THE Chicago Fat Stock Show, a New York State Holstein cow took first prize on butter record, and a Pennsylvania Holstein second.

MORE intimate trade relations with the South American Republics seem inevitable. Will they operate advantageously for the farmers of the United States?

AN organization with the title "The National Dairy and Food Commissioners' Association of the United States" was formed in Cleveland, Ohio, on Wednesday.

ALL farmers are interested in the figures giving the cost of living on the farm. These figures tell some curious tales. By-and-by we shall give the cost of life in towns and cities. Then our readers can estimate what their wood, milk, butter, eggs and poultry are worth.

ALLUDING to the communication on "Cross-fertilization of Grapes" on page 806, the R. N.-Y. would say that it has had quite a little experience in such work. We have always *removed* the "cap" to apply the foreign pollen and have found in almost every case (the flower being *perfect*) that the pollen is ripe before the cap falls. Probably, however, the stigmas are often receptive after the fall of the cap in the case of varieties having imperfect stamens.

IT appears that the Western silo men have little use for heavy weights or jack-screws on their silos. Some of the men who write for this issue of the R. N.-Y. have made the silo so successful that they are able to keep a cow for each acre of land they own. It is evident that "patent" silage will not find many takers among these men at present. Still, the R. N.-Y. can only say that of all the samples of silage it has ever seen the sweetest and most palatable was that made by Mr. Colcord's patent.

A CORRESPONDENT, page 806, speaks of feeding a ration consisting of half oat-meal and half corn-meal to dairy cows. The R. N.-Y. has been feeding whole oats to a dairy cow. We find that the oats are more completely digested than whole corn and that they certainly increase the cow's milk yield. The butter, however, is not equal to that produced from clear corn-meal. In this experiment oats were fed alone. With one-third oat-meal and two-thirds corn-meal we do not notice any inferiority in the butter.

OH DEAR! those horrid, bothersome German chemists! Another of them has just "discovered" another substitute for butter! It is a fatty substance in the cocoanut. Of course, in many respects it is better than genuine butter; but, all the same, it is sold under the name of "the inferior product." It is being turned out in vast quantities at Manheim, a single factory producing 6,000 pounds a day, worth in the wholesale market 15 cents per pound. A very stringent anti-oleo law has just been passed by the Reichstag, which goes into force in all the German Empire on January 1, 1890. It forbids the sale of any imitation or any substitute for butter unless there is plainly stamped on the cover or article itself a statement that it is a substitute or imitation. Butter is defined to be "the article of fat in which, besides salt and coloring, no other ingredients appear except those coming from milk." It would be interesting to compare the effects of this law in Germany with those of the anti-oleo laws, national and State, in this country. According to the report of Commissioner of Internal Revenue, the other day, in spite of all legislation and of the boasts of the Dairy Commissioners and their assistants in various States, there has been a large increase in the manufacture and sale of oleomargarine during the past year in the United States.

Farm Topics.

ABANDONED FARMS.

(*Continued from Page* 804.)

list. The State Commissioner sent me a circular and I filled it out; but stated that it was not an abandoned farm though it was for sale. I took it for an investment and for the timber. It has been occupied I suppose for 100 years. It is not worn out. It is productive and well located two miles from a railroad depot, church, etc. My health is poor and hence I would be glad to sell. There are various reasons for the abandonment of farms hereabouts. 1. Our young men do not like to work on the farm. 2. Help is scarce and wages are high. 3. Our farmers do not keep their farms in a paying condition. They spend too much time riding about. They must all have covered buggies, etc. 4. Some of the farms are run out. 5. Many are too far from a railroad and a market. If we had a lot of thrifty Germans and Swedes, however, they would do well.

Grafton County.

FROM W. A. RUSSELL.

Why are the farms deserted in our town? Twenty years ago District School No. 3 had, during the winter term, between 60 and 70 scholars; now there are only five. Where are the people gone? One by one they have sought the commercial centers, until their old homes are nearly deserted. Most of them, like myself, thought farming too hard, or too dull a life, and now as the fathers and mothers pass away, no one of the family is ready to take their places. Twenty years ago the farmers never thought of buying grain, but to-day they can do so cheaper than they can raise it. Then corn and potatoes brought good prices, and if the farmers had a surplus, they could readily dispose of it at a good profit. Yet to-day, if a man is willing to earn his bread by the sweat of his brow, he can do so here on the farm, and no man gets more out of life than the independent farmer.

Middlesex County, Mass.

FROM O. H. ALEXANDER.

A great deal has been said about abandoned farms in Vermont lately. I do not know of any on this side of the Green Mountain range. I think the time is coming when more of our young men will remain at home and stick to the farms. Our Champlain Valley is one of the most charming places to live in in America. The scenery and soil cannot be surpassed and our society is first-class and our schools are excellent. No blizzards or hurricanes visit us; nor are there any thieves or burglars to speak of.

Chittenden County, Vt.

Everywhere.

A SUMMER OUTING IN THE NORTH CAROLINA MOUNTAINS.

II.

MARY WAGER-FISHER.

The "Land of the Sky;" the Blue Ridge and blue flowers; Mount Mitchell; a lonely grave; a high fountain; railroad gymnastics.

FROM Salisbury on to Asheville the country was charming. Wheat was being harvested, there were more and better houses, the smart hotels at the stations had quite a Northern look, and wealth and thrift were apparent in various ways. All the time the train was climbing higher into the mountains, the blue of the distant hills being of a most soft and exquisite hue, owing, possibly to the deciduous character of the trees with which they were clothed. The fleecy clouds were floating much nearer, and we had entered the "Land of the Sky." Miss Fisher (Christian Reid) who writes gracefully of Southern life, lives in Salisbury, and one of her books which she calls "The Land of the Sky," is a light and amusing account of the experiences of a party making a tour in the mountains.

From the time we were well in the mountains confusion reigned in my mind as to our whereabouts. Mountains were everywhere, a great brood of them, and there were no distinctive peaks, or ridges to my eyes. But to the natives, this was the Blue Ridge, that the Great Smoky, yonder the Nantehalah, afar the Blacks, and everywhere the Appalachian or Alleghanian Range. It didn't particularly matter, and to assure myself that I was in fact somewhere, I mentally classified everything as the Blue Ridge. A new, curious and very blue flower, growing in a tall spike flourished in abundance by the roadside, and I asked the car conductor what the people called it. He said he had never heard a name for it, and after some further talk he gave it as his opinion that the mountains had been named Blue because of the abundance of this flower. Some days later while walking in Asheville, I leaned over a garden fence where a young woman was gathering a nosegay and asked the name of a flower, new to me, which I saw growing therein. She did not know it, and when I commented on the blueness of her larkspurs, she said that she never before knew what they were called, and she had seen them from childhood! She probably wondered why any one should bother her head about the names of things.

Before reaching Asheville, the railroad performs various engineering antics in getting across the top of the Blue Ridge, and particularly is this the case in getting around and over what is called the Round Knob. In this place where the mountains and the rail track play at hide-and-go-seek, a hotel has been built, and by the damming up of a mountain stream, a fountain was established which threw up a stream 268 feet high, which, in American parlance, was the highest water jet in the world. But it did not jet when we saw it, and from all accounts it seemed to have lain inactive for some time. When well over the Knob, Mt. Mitchell comes into view. This mountain with its well rounded top would not attract special attention for its hight, which is 6,711 feet, 426 feet higher than Mount Washington in New Hampshire, and there are 20 other tops in North Carolina higher than Mount Washington. But it was on the top of this mountain that Prof. Mitchell—who was a New England man and the first to ascertain and publish the fact that the Black Mountains of which this is one, are the highest land east of the Rockies—lost his life, and is now buried in a lonely, cloud-enveloped grave. It was his third ascent to the top, and he went alone. As several days passed and no news came of him, a party, with an old mountaineer for guide, went in search of him, and found his body lying in a pool at the foot of a precipice some 30 feet high, over which he had probably fallen in the darkness or obscurity of the clouds. His body had been wonderfully preserved by the pure air, and it was taken down the mountain to Asheville, for interment. Some years afterward, it was thought proper by his scientific friends, that his body should permanently rest on top of the mountain which bears his name and is his monument, and with inconceivable difficulty, it was borne to the top, accompanied by a cortege of scientific men, who were three days in reaching the summit.

Now, quite a good many tourists annually make the ascent, which can be done on horseback, as there is a fairly good trail to the top, from which the view, if the clouds are off the mountain, is vast and magnificent. A young South Carolina woman told me she had thrice made the ascent, once on foot, camping over-night midway up the mountain. Professor Mitchell's grave is without name or headstone, but a wall of loose stones that surrounds his resting place, receives an additional stone or two from every visitor. When the projected railroad to the summit is achieved perhaps some further protection will be given to this singularly sad grave in the clouds. Bear and deer still abound in these mountains, as well as wild cats and no end of "razor-back" hogs, and it is a custom among the mountaineers to roll a log on the top of a newly made grave, to prevent the body from being disinterred by hungry beasts.

When within a mile or so of Asheville, the railroad sweeps along by the French Broad River, where it is joined by the Swannanoa, and we caught a few pretty glimpses of this stream so celebrated for its picturesqueness. But its waters were muddy, and for a mountain river I thought its charms had been overrated; but it may be charming in spots, as it sweeps on in its course to the Tennessee.

Asheville I would think must be pretty from any point of view from which it is approached. At all events, it seemed to me like an oasis of civilization and comfort in those mountainous wilds, and its pretty little new railway station, with its white fence at one side to keep quarreling hackmen at a respectful distance, was grateful to see, as we left the cars for another night's rest.

RURAL SPECIAL REPORTS.

Delaware.

DOVER, Kent County, November 19.—Corn is about all housed; the crop is not a large one even in the most favored sections, and I don't think I am far wrong in estimating that one-third of the whole corn area in the State will return but little more than the seed. We have not had four consecutive fair days since April 15. Corn-fodder is much damaged and the loss in its feeding value will be seriously felt. Public sales are more numerous this fall than they have been for a long time. Many farmers are quitting farming for various reasons. Stock sells low, but feed of all kinds brings full value. Wheat has made a good start; not much difference can be seen between early and late-sown. Stock are still on pasture although being fed some in the yards at night. Late potatoes were a fair crop; there are some complaints of rot now. The present outlook for farmers is not the brightest. Prices for what we have grown are low and the demand light. There are not apples enough for the home demand. The factories will soon begin to put up poultry; but little is being shipped as the prices obtained at home are about equal to those at the city markets. The ground has been slightly frozen a few times, but for the greater part of the time the weather has been warm and wet. Market quotations: Wheat, 70 cents; corn, 35 cents; oats, 30 cents; hay, $10@$15; potatoes, white, 40 cents; sweet, 50 cents; pork, $5.50 per cwt.; poultry, nine cents@11 cents; eggs, 25 cents; butter, 20 cents@25 cents. A. G. S.

Woman's Work.

CONDUCTED BY EMILY LOUISE TAPLIN.

CHAT BY THE WAY.

NOWADAYS, when education is supposed to be the rule, not the exception, it is a little surprising to find so many girls and women who cannot write a decent letter. No matter how prettily a girl writes, whether the round, flowing hand taught in the public schools, or the big, angular sprawl of fashion, she is no correspondent if she forgets to put her full address and date at the head of the letter. A great many do forget this, and at times it is particularly exasperating. Entire street and number, if in a town, or full post-office address in any case, should never be omitted. The date, too, is often forgotten, a very exasperating thing when any engagement is made, either for business or pleasure. As for punctuation, many a woman has no idea beyond a dash or a comma, unless it is the parenthesis. Colons and semicolons are entirely ignored. Nothing is more bewildering than to wade through a lengthy and indistinctly written letter where sentences are divided or terminated only by the dash, but several of our girl friends are guilty of this fault.

Good spelling is surely within every one's reach, yet many a woman is deficient in it. Judging from the many fairly educated persons who can never recollect the difference between ei and ie, or the changes from a single to a double l, we begin to think that Dogberry was right in saying that writing and reading come by nature. Such unfortunates might remember the clever scheme of the old Duchess of Gordon, who it is reported, said: "You know, my dear, when I don't know how to spell a word I always draw a line under it, and if it is spelled wrong it passes for a very good joke, and if it is spelled right it doesn't matter." Unfortunately, it is the easy little words one usually spells incorrectly; people who write their "thare" will usually look in the dictionary before venturing on polysyllables. In conclusion, while we admit that bad spelling does not by any means invariably imply lack of education, it certainly does show carelessness in any case, nor can we consider any woman fully educated if she is unable to write a well-composed, correctly-spelled letter in her own language.

* * *

WE recently saw some individual salt-cellars which were both pretty and cheap. They were little tiny oval Japanese baskets, made of bamboo lined with red lacquer; they were clean, unbreakable and quaint-looking, having a very pretty effect on the table. It is surprising how many pretty little Japanese articles one may buy for the table, to give a relief from ordinary white ware. Butter or cheese plates, pickle and sauce dishes, dessert plates or salad bowls—any odd pieces—may be purchased in Japanese ware, and all are within the reach of small purses. Even when not in fine china, the quaint oddity of shape and design, or the brilliant coloring, makes it uncommon and decorative, to the very great improvement of a plain tea-table.

PLANNING FOR CHRISTMAS.

OLIVE E. DANA.

WE have been pondering over our Christmas gift-making some time already—the most of us—have we not? And some of us are no nearer decision than when we began to plan and ponder. It is sometimes so hard to suit at the same time, one's friend, ones-self and one's pocket-book.

A gift should be tried by at least three tests—its own fitness, the recipient's needs and tastes and the giver's ability. How many of the presents we have given in other years abide such testing?

It is fortunate that hands as well as heads may help in the Christmas preparations. Fingers can eke out scanty funds and the gift into which love's labor goes is doubly precious. Still, our labor is not always well spent. It seems to me that every gift ought to be so chosen that it will be and bring, of itself, no less than as the expression of friendship or affection, some real help, solace, cheer, however slight. And the best gift is the most serviceable. I use the adjective, of course, in its broadest sense. After love, which is itself wise and tactful, it seems to me that judicious gift-making requires nothing so much as tact. The quality grows, too, by exercise. Shall we not try to use a good deal of it, and of its sister-virtue, pre-thought, in choosing our Christmas gifts?

More and more, it seems to me in manufactures, in fashions, in the growing realm of decorative art, skill, taste and energy are being freely expended on articles designed for common use.

More and more artists and artisans seem to feel that talent and labor are well expended if through their products men's and women's daily tasks are lightened, or their common life dignified or elevated.

And, following the same trend, all the various womanly accomplishments vaguely defined as "fancy-work" are in demand not only that a few pieces of fragile bric-a-brac may be added to the furnishings of parlor or sitting-room or chambers, but to supply articles of real use, convenience and beauty for every department of housekeeping.

Those skilled in needle-work ought to be the last to find it hard to prepare dainty and valuable gifts. If the friend or acquaintance one wishes to remember is mistress of a home, and covetous for its adorning, there is wide room for choice. Just for the dining-room, numberless pretty and useful things may be made. A linen table-scarf done in outline, with knotted fringe, is a graceful adjunct. Tray-cloths and carving-cloth are always acceptable, and vary sufficiently in design and in quality to suit all tastes and purses. Doylies and the fringed and outlined tea-napkins swell the list, while, if one desires something even simpler, a table-screen may serve the purpose. This, for a table of ordinary size, is made of a width and a-half of cheese-cloth, two and a-half yards long. It has a hem, an inch and a-half in depth, fastened by feather-stitching, done on the *right* side. The screen has also a design in each corner done in outline. One lately done has simple designs taken from stamping patterns, of creamer, sugar-bowl, cup and saucer, tea-tray, etc., done in red tambour cotton. It consumed very little time in the making, is convenient and tidy, and it may be washed. Table-mats, crocheted of heavy white cotton make an acceptable gift to the house-wife, who might also be gladdened by any of the "cozies" recently introduced and now so much in vogue. If one has very little time or skill, a pair of handsome towels may be bought, and worked with the initial letter of their future owner, or perhaps the monogram, done in outline or in solid embroidery, with washable silk corresponding in color to the border of the towel.

In the way of pretty things to wear, also,

there is wide scope for skill and ingenuity. A pair of the pretty knitted undervests which grow so rapidly under the fingers of the practiced knitter, would delight almost anybody, as would a "hug-me tight" jacket knitted after the same fashion. A pretty change from the knitted under-skirt is afforded by the embroidered flannel found in the stores. A skirt made of this material, with or without the silk crocheted edge which goes with it so well, is a dainty garment and would be a possession valued by most women.

THE HOME PAPER—A PROTEST.

S. J. L.

I OBJECT to J. H. G.'s statement in the R. N.-Y. of November 16, regarding the opposition of farmers' wives and daughters to agricultural papers. He must meet many strange women, judging from his articles. He invariably enjoins upon the women that *they* must do so and so, or everlasting ruin will close down upon them, and now he attributes the disintegration of the home circle to the mothers' and daughters' cruel suppression of the agricultural paper. In this era of papers which combine all that is practical in agriculture and entertaining in domestic affairs, there are very few who would wish to replace such a paper by trashy literature, and, besides, a man seldom needs an excuse for spending $2 a year as he likes, his wife to the contrary notwithstanding.

Farmers' wives, as a rule, are in favor of more papers than their husbands, and where trashy literature predominates, I always notice the husband is quite as much interested in the fate of the heroines as his wife is. A good agricultural paper is everything to a farmer; but that is not a full recipe for preventing boys from leaving the farm.

A sensible father is the best preventive yet discovered; one who teaches his boy self-reliance, and has confidence in his ability to fill responsible positions, praising where praise is due, and not forgetting to give him a tangible interest in his work. With something definite ahead, the average boy will remain on the farm when most needed.

Sensible mothers are also in demand to equalize the temperature between father and son, a position which I know is hard to fill, but it is done with great credit all over our land.

GOLDEN GRAINS.

PHILLIPS BROOKS says no man was ever yet hurt by knowing too much..

A LITTLE learning is a dangerous thing; but the danger is not in the learning but the littleness.....

"Truth, for Truth is Truth, be worshipped, being true as he was brave;
Good for Good is Good, he followed, yet he looked beyond the grave."

SOCRATES said: I study how I may present my soul before the Judge, whole and undefiled; and so, bidding farewell to those things which most men account honors, and looking onward to the Truth, I shall earnestly endeavor to grow, so far as may be, in goodness, and thus live and thus, when the time comes, die.....

Now, every one who suffers punishment, if the punishment has been rightly dealt him by another, must needs either himself be made better and thus benefit thereby, or else serve as an example to others, that they, seeing the sufferings which he endures, may be made better through dread of them.....

AND those who are benefited by receiving punishment from gods and men are they who have committed sins not past cure; nevertheless, both here and in Hades, only through pain and suffering does the benefit come to them, for there is no other way whereby they may be set free from injustice.....

BE courageous and noble-minded; our own hearts and not other men's opinions of us, form our true honor.....

EDUCATE the whole man—the head, the heart, the body: the head to think, the heart to feel, the body to act.....

WE cannot conquer fate and necessity, but we can yield to them in such a way as to be greater than if we could.....

THE more our gifts and graces are exercised, the more they are strengthened and increased. All acts strengthen habits.....

THE CHRISTIAN STANDARD says some people have not yet had the sentimental softness sanctified out of their spirits, nor the whine out of their voices, nor the general debility out of their deportment, nor the clinging dependence on everybody else but God out of their lives, nor the disposition to exist without good, honest labor out of their business arrangements, nor the "holy twang" out of their conversation and prayers, nor the languid affectation out of their manners!.....

OH! for a baptism of manly, stalwart, frank and stirring sanctification that can look every one in the eye, that is not continually asking favors, that does not go round apologizing for its own existence and presence, that knows some interval when it has not some special "ax to grind," and that can occasionally devote itself to unselfish care and consideration and labor and sacrifice for others! Equally from the sourly severe and the softly sentimental, good Lord deliver us!.....

OUR greatest gratitude should be that God does not regulate His gifts to us by the measure of our gratitude to Him. And as we have received, so ought we to give...

WE cannot afford to waste, or ignore, or despise anything, for, however useless it may appear to our short-sighted vision, we know not what treasures of future growth and advancement may be enfolded within it, or how readily it may respond to wise culture, like the tiny germ that is nourished in the warm soil and strengthened by the refreshing rain.....

DON'T always search for the serious side of things. The man who has no eye or ear to the ludicrous is an unhappy mortal. Next to virtue, the fun in the world is what we can least spare.....

"LIFE sometimes overlays the soul in the face with disturbing hieroglyphics which gentle death smooths away showing worthy writing there."..... .....

I NEVER feel that any man occupies my place, but that the reason why I do not have what I wish is, that I want the faculty which entitles. All spiritual or real power makes its own place.....

NATURE never hurries: atom by atom, little by little, she achieves her work.....

THE most cross-grained are by no means the worst of mankind, or the humblest in station the least polished in feeling.....

Domestic Economy

CONDUCTED BY MRS. AGNES E. M. CARMAN.

She could swing a six-pound dumb-bell;
She could fence, and she could box;
She could row upon the river,
She could clamber 'mong the rocks;
She could do some heavy bowling,
And play tennis all day long;
But she couldn't help her mother,
'Cause she wasn't very strong!

—W. C. Sheppard in Puck

CHRISTMAS WORK.

NO one can make a Christmas gift from pure motives without feeling a certain amount of pleasure in so doing. But the woman having abundant means who purchases her gifts knows not the joy which one feels who plans and makes them herself. Happy anticipations of the pleasure the gifts carry with them lighten the work and loving thoughts are worked in with every stitch. But, busy, generous, loving little woman, do not postpone the making of them until from necessity you must work early and late, while you hurry and fret, thus robbing yourself of nearly all the pleasure you might have had in the work, besides being too tired and worn to enjoy the day when it comes. The directions I here append are for easily made articles all of which admit of the use of a wide range of material and various kinds of decorations. Take an inventory of all the odds and ends of pretty things among your belongings, and see if you have not the wherewith to begin at once.

Matting of different qualities is now being used for decorative purposes with excellent results. Painted in oil, boldly, and with an eye to effect rather than elaborations of detail, it makes beautiful mountings for screens and wall hangings or banners. For the former China matting, such as is used for floor coverings, in fine quality, is best, and either white or brown makes the most effective back-ground for painting. Floral designs are usually selected for screens, and treated in a bold, rather conventional manner. Lighter grades of matting can be used for wall hangings. Such pieces are fringed out at the lower end, mounted on a bamboo rod and hung up by a ribbon at each end. One recently seen was of white China matting and the design painted on it was a grape-vine, fruit and leaves. Across both top and bottom was a very effective decoration made with Manilla rope of the size commonly used for a clothes line. That across the top was in one piece put on in loops; that across the bottom consisted of several loops and ends with a straight piece of rope passing through the loops. First ascertain how long a piece is needed for one ornament, then measure accurately for the others. With cream linen thread fasten the strands securely three inches from each end, and ravel out below this for tassels. Sew evenly and strongly to the hanging, connecting by the straight piece woven in and out of the loops; let the ends and tassels hang below. Run a bamboo or other rod through the upper loops and suspend by a rope. Half-inch gilt or wooden poles can be obtained at an upholsterer's, with small brackets for holding them.

A unique and handsome towel holder is made in this way: A band of plush four inches wide is lined with figured China silk. Gather the ends closely and fasten with small ribbon bows to two large oak rings like those used on curtain poles. Midway between the ends gather the plush and fasten to a third ring by which it is suspended. Any material can be substituted for the plush and the goods may be embroidered in any stitch. Ivory or rings of any kind of wood may be substituted, care only being used to have them large enough to allow a good-sized towel to pass through easily.

Scarfs for decorating mantels, pictures, easels, etc., are made of various materials, either embroidered, painted, with drawn work across the ends, or of figured China silk with only a trimming across the ends. Small silk tassels can be easily made and small pieces of silk can be utilized in this way. First cover small-sized brass rings with silk in single crochet stitch, care being taken to make the stitches even and close together. After covering the rings make full tassels through them and either connect them with invisible stitches, or leave a small space between each two. A beautiful mantel scarf was in figured China silk: the cream ground was quite closely covered by an Oriental design done in several shades of dull blue. The center tassel was in the lightest shade of blue, the others shading to dark at the sides. Always remember that in shading from light to dark the second gradation must be double the amount of the first, the third three times that of the first and so on. Threads, zephyr, worsteds, embroidery silk, flosses, crewel, etc., may be used in covering these rings, and they are appropriate for piano or table covers, scarfs or fancy bags.

Of bags there is almost no end. Those made of handsome plush or heavy, dark-colored silk are liked better for shopping bags than more showy embroidered ones. The casing for the draw-string is about three inches from the top. Ribbon and heavy cord and tassels vie with each other in popularity for the shirring and to carry by.

Bags of this style—but only long enough to admit of a pack of cards being easily slipped into them—have the joker fastened securely on one side by full bows of narrow ribbon at each corner, in color matching the lining and shirring ribbon.

Pieces of ribbon sewed together make handsome bags, or a combination of ribbon and strips of either plush or velvet may be used. Pretty bags for dusters are both ornamental and useful. We are often annoyed by the sight of dust on bric-a-brac, which we could instantly remove had we a duster at hand. Cover a round piece of card-board four and a-half inches in diameter. Take an oblong piece of goods 11 by 24 inches, gather at the bottom and sew to the edge of the card-board in over-hand stitch. Line and put a shir near the top, through which to run a ribbon by which to suspend it. Figured sateen lined with the plain, makes pretty serviceable bags for either dusters or soiled clothes. A piece of cheese-cloth one yard square, with an inch-wide hem on each side, cat-stitched in yellow linen floss, makes a handsome and good duster.

A small bag gathered a little ways from the bottom and drawn up so as to leave a small opening in the center, is convenient for a ball of twine, with the end drawn through the opening; shir at the top and attached to the shirring ribbon have a long loop of narrow ribbon to which is attached a pair of small scissors.

A handsome lamp-shade was made of pink surah silk. A piece four inches wide was shirred three times, quite close together, near the top, leaving a half-inch wide frill. The bottom was trimmed with Oriental lace slightly fulled on and at regular intervals pink silk tassels were attached to the hem and allowed to fall over the lace.

A bright-yellow one was very handsome and had once done duty as a white silk muffler. After having been dyed, a circle was cut out of the center large enough to allow of its being gathered enough to hang prettily, and at equal distances apart the bottom was trimmed with white silk tassels.

A large, polished horn makes a handsome hair-receiver by the addition of a four-inch-wide puff of silk, satin, or plush sewed to the large end, and bows of ribbon corresponding in color are fastened at each end with a ribbon to hang up by.

Very many pretty things can be made of white seine twine, such as brush-broom holders, hair-pin receivers, jewelry trays, thread baskets, etc. In short, given this idea, an ingenious crocheter will find an unlimited field in which to exercise her talent. Crochet fine twine in small shell stitch, shaping the article to fit some dish over which it is to be dried. After being starched twice in starch made of coffee instead of water (when perfectly dry) give the article two coats of shellac varnish and then paint with either gilt or brown liquid paint. A work basket was shaped over a two-quart basin, each scallop around the top being carefully pulled out and pinned to the board on which it stood to dry. Rings an inch and a-half in diameter were crocheted in single crochet and tied with coffee-colored satin ribbon to each side, and a bag of surah satin in the same color was sewed to the top just inside the scallop around the edge.

Japanese baskets are decorated in innumerable ways with ribbons and lace, the latter usually in hand-knit cream linen, or in white Oriental lace. Small round baskets make handsome burnt-match receivers by gathering a frill of lace to the top and letting it fall over the sides with silk tassels fastened in the scallops at the edge. Put a small glass tumbler inside, and suspend by ribbons or use standing, as preferred.

A chair or picture scarf is handsome crocheted out of cream linen thread and tied at the center with a picot-edged moire ribbon.

A great variety of articles are made of chamois leather, either alone or in combination with plush. It is handsomest painted, but ink drawing is very pretty on it. Tobacco pouches are drawn up by two ribbons run through slots cut near the top and the chamois is cut evenly to a depth of two inches at the bottom for fringe. Fringe can also be made in this way of felt, for table scarfs, etc.

Four thicknesses of blotting paper with a decorated cover of chamois pinked out around the edges, and tied at the back with ribbons drawn through holes made through both leaves and cover.

Panels of strong card-board the size of a cabinet photograph or larger, make handsome calendars by first covering them with two thicknesses of cotton wadding, then with plush, being careful to get it on perfectly smooth. Near the lower right-hand corner fasten a calendar; near the upper left-hand corner paint or embroider a spray of flowers, or else make a handsome butterfly done of picot-edged moire ribbon in a color contrasting with the plush. These can be suspended by ribbon from the wall, or stood on small gilt easels.

Simple but useful presents are bath cloths of white Turkish toweling with a small scallop crocheted all around them of knitting cotton.

A combing towel is another easily made present. A pretty damask towel is folded lengthwise and cut to fit the shoulders and cut around the neck and down through the middle of the front. Narrow lace is put around the neck for a frill, and the fronts

Miscellaneous Advertising.

When Baby was sick, we gave her Castoria,
When she was a Child, she cried for Castoria.
When she became Miss, she clung to Castoria,
When she had Children, she gave them Castoria

are finished to button with three buttons. Simple designs, brush, comb, etc., can be outlined in colors near the front border, if desired.

A homely but very acceptable gift for an old person is a night-cap crocheted out Germantown wool. Old people are often made wakeful by having cold heads, and these caps are a great comfort to such. Crochet a chain four inches long for the center of the back, then crochet around it in double crotchet. Now go back and forth, widening to fit the head, finish with a shell border all around. Crocheted or knit shoulder capes are rather old style, but a most acceptable gift, particularly to an elderly woman.

A great variety of articles can be made from butcher's linen; splashers, bureau and wash-stand scarfs, tray cloths, bread doyleys, etc. They can be outlined in wash silks, in white silk, or for common use in white linen floss. The edges can be fringed or trimmed with either knit or crocheted linen lace, or they can have a hem-stitched hem all around them. Tidies and scarfs for chairs can be made very handsome by outlining a design in colored wash silks, and trimming the ends with linen insertion and lace. Nearly every housewife is delighted with any gift which adds to the attractiveness of her table. And most of us are not in such affluent circumstances as not to prefer presents combining beauty with usefulness. KATHERINE B. J.

WE have seen something new in paper weights. They are of wood and called "the natural wood of Jerusalem," whatever that may be. The weights are cross-sections of a close-grained wood, three or four inches in diameter and an inch in thickness. The upper surfaces are rubbed smooth, "hand-painted" and varnished. We think that cross-sections of seasoned Red Cedar from "the State of New Jersey" would make capital weights. After bringing out the grain by rubbing, a timely inscription might be tellingly traced in silver or gold paint. Varnish or not as you may fancy.

HOLIDAY FANCIES.

NOW that the season of universal gift-giving is not far away, busy hands are preparing many dainty and beautiful tokens in loving remembrance of the season's customs. A few hints on the subject may prove profitable to those who have more time than money to spend in such ways. When one has a large circle of friends to be remembered, and every gift must be bought, the expense is by no means light, but every one has bits of silk, ribbons, velvets, etc., from which many useful and fanciful things may be fashioned.

A novel and pretty scrap bag is made of a square piece of card-board folded like a cornucopia, and covered with flowered silk. The edges are finished with silver cord and a deep bag of the silk is fastened in the top. This is gathered at the lower edge before it is put in. Casings are run at the top of the bag and narrow satin ribbons drawn in for closing it, enough being left at the top to form a frill above the casings. Tie the ribbon in long loops and support the bag by one of the loops thrown over a nail. This is very pretty hung in a corner.

A pretty case for a clothes-brush consists of a diamond-shaped piece of card-board covered with plush, with a band at the back through which the brush is thrust. Suspend by a narrow ribbon. The plush may be decorated with painting or embroidery.

A useful present for the house-wife is a bag for holding keys. This is nicest made of chamois leather. Cut the desired size and line with scarlet silk. Leave enough at the top to form a heading and make a casing for a draw-string, for which use narrow scarlet ribbon. On the leather embroider the word "keys," using wash-silks to match the lining.

Every one who crochets or knits should have a bag to keep her work in. These can be made very handsome, but a plain one is the best if it is to be much used. A very pretty one is made of a piece of silk 14 inches square. Make a narrow hem on all sides, and about three inches from the edge sew on small brass rings four inches apart. Sew a tiny plush ball in the center of the bag and one at each corner, and run a ribbon through the rings for drawing up.

A handsome photograph case is made of chamois leather lined with violet satin. It is folded over about two inches at each end, thus making two shallow pockets on one of which is written the word "Photos" in gilt letters, while on the other is painted a cluster of violets. Ties of violet satin ribbons are fastened at the ends for closing the case. This makes a very dainty and delicate case for small pictures.

A useful present for a gentleman is an umbrella case. Procure a board 30 inches in length and eight in width and give it a coat of white enameled paint, with a line of gilt at the edges. For the case take a strip of heavy white canvas and make a wide box plait of sufficient depth and width to hold an umbrella. Bind the edges with blue silk braid. Make a row of feather stitching across the top and bottom of the case, working it with blue silks to match the braid. At the top or front of the case place a full bow of delicate blue and cream ribbon. If you paint, add a spray of pink roses at top and bottom of the board. Tack the case to the board with small brass-headed nails, and at each of the two upper corners of the board place a small brass ring for suspending the case from the wall.

Another pretty gift for a gentleman is a case for neck-ties. Cut a piece of leather board 20 inches long and half as wide. Cover with either velvet or satin, and line with soft silk. A band of narrow ribbon is fastened across the case at the top, and another near the bottom, for holding the ties in place. Fold the case together lengthwise, which makes it when completed 20 inches long and five wide. Fasten a large initial letter in silver upon the outside of the cover

A handsome blanket for a baby may be made from a square of cream-colored oatmeal cloth. Embroider single blossoms of golden coreopsis at intervals over the entire surface, and bind the edges with ribbon to match the embroidery.

A pretty receptacle for watches, chains, etc., is made of a strip of very wide ribbon. One end of the ribbon is turned under to form a pointed pocket, and the remaining part is made into a bow formed of a loop and two ends. Decorate the front of the pocket with an embroidered branch of flowers.

A home-made picture frame is made of heavy rope. It should be as large as a man's thumb. One row is tacked firmly to a narrow wooden frame and another is fastened outside of that, finished with large knots at each end. Gild carefully and when perfectly dry, give it a second coat.

For a handsome hair-receiver take a small palm-leaf or Japanese fan and cover with silk of any shade preferred; pale blue or scarlet is prettiest. Line the reverse side with cambric or silesia. Make a shirred pocket of the silk and attach to the lower part of fan. (The handle should be turned upward.) Across the pocket just below the top fasten a celluloid "back" comb, placing loops of tri-colored ribbon at each end of comb. Finish fan all around with heavy silk cord. Suspend by loops of ribbon tied on the handle. MARGARET PERCY.

CHILDREN, both sexes, still wear black stockings. We were recently told at one of the large stores that they had black stockings and those only for children.

A PLEASING GIFT.

A DAINTY, inexpensive little gift may be made as follows:

Two pieces of satin ribbon of contrasting colors (light-blue and pink, cream and blue, apple-green and pink, or peacock-blue and pink) may be used with pleasing effect, each one and three-fourths inch wide and six inches long. Fringe the ends of each about one and a-fourth inch in depth. Then sew together, invisibly, two sides so that there will be no seam or ridge. A pretty spray painted or embroidered on this adds much to the effect, though it is not essential. Take a piece of satin ribbon of either color used, six inches long and three or three and a-half inches wide, and fringe each end 1¼ inch. Now place the strip first made on this other so that the edges and fringes are at right angles, and put between, two thin layers of cotton wadding about two inches square sprinkled with sachet power.

Fasten together with a tiny silk cord or chenille ribbon such as is used in embroidering, of either color, by taking a single stitch through both upper and under ribbon half way between the corners, leaving the two ends to each stitch, to be tied in a tiny bow (making in all four bows).

Now you have a dainty little sachet which mother, sister or even the brothers, will be glad to place in among the handkerchiefs and ties. MRS. H. W. C.

A FIRST-RATE INEXPENSIVE GAME.

THE game of bean-bags is one of the few games which can be played and enjoyed by all the members of a family, from "grandpa and grandma" down to the little folks. The bags and board necessary are inexpensive and easily made. Directions for making the board are as follows: Take a perfectly smooth, strong board 22 inches wide and 36 inches long, and cut a hole seven inches square, equally distant from one end and the two sides, (the distance will be seven and a-half inches.) Make an inclined plane of this board by supporting the end near the hole with a board 22 inches long and 11 inches wide standing on edge, thus making the width of this board the hight of the inclined plane (11 inches.) Join them by means of hinges.

Ten bags, each six by eight inches, are made of strong cloth (Canton flannel of different bright colors is nice, though ticking or heavy gingham answers every purpose) and nearly filled with beans. (Corn may be used if more plentiful than beans.) The bags must be sewed carefully, and all ends of threads securely fastened. They should all be of about the same weight except "Jumbo," the 11th bag, which should be eight by 11 inches and nearly double the weight.

The game is played by standing at a distance of 15 feet or more from the board, and throwing the bags one by one into the hole. Each of the 10 small bags thrown into the hole scores 10, each one resting on the board scores five, and each one thrown clear off the board counts minus 10. "Jumbo" thrown into the hole scores 20, on the board 10, off the board *minus* 20. To determine what the bags resting partly on the board and partly on the floor shall count, lift the board gently after all the bags have been thrown. If they *then* remain on the board they count five each, but each one that slides off counts *minus* 10.

The highest score possible is 120.

In a large company it is exciting and interesting to "choose sides."

MRS. H. W. COLLINGWOOD.

LONG pocket-books are no longer fashionable. The usual size now carried is 4⅛ by 2½ inches. Black is preferable to colors.

The Aged

Who need help in their many infirmities, especially those afflicted with rheumatism, find great relief in

AYER'S Sarsaparilla.

"One year ago I was taken ill with inflammatory rheumatism, being confined to my house six months. I came out of the sickness very much debilitated, with no appetite, and my system disordered in every way. I commenced using Ayer's Sarsaparilla and began to improve at once, gaining in strength and soon recovering my usual health. I cannot say too much in praise of this well-known medicine." —Mrs. L. A. Stark, Nashua, N. H.

News of the Week.

HOME NEWS.

SATURDAY, November 30, 1889.

MONDAY, lively little Lynn, Mass., the "Shoe City," had the third greatest fire that ever cursed New England. Boston's fire in 1872 caused between $100,000,000 and $125.000,000 damages; Portland's fire in 1866 caused $12,000,000; the loss by Lynn's which burnt up 160 acres in the heart of the place, is estimated at from $7,000,000 to $10,000,000 .....On Thanksgiving Day morning a fire broke out in the business part of Boston and burned fiercely for eight hours before it was controlled, causing a loss of between $5,000,000 and $6,000,000..... An extra session of the West Virginia Legislature is to meet on the second Monday in January to decide on the contest between the Republican and Democratic candidates for Governor....."Road agents" out West were busy and lucky during the early part of the week. Within three days two stage robberies netted them $80,000, one yielding $50,000 and another $30,000, while by "standing up" a railroad train, they cleared less than $2,000.....

FOREIGN NEWS.

SATURDAY, November 16, 1889.

THE Sultan is reported to be willing to cede Turkish Armenia to the Czar in return for the cancellation of the indemnity which Turkey agreed to pay at the close of the late Turko-Russian war; but which the bankrupt condition of her Treasury has prevented her from doing. Such a scheme may help to stave off the demise of the "Sick Man of Europe" for another generation, more or less.....It is said that Russia and Germany have agreed that Prince Ferdinand shall be removed from the throne of Bulgaria in spite of the fact that the Bulgarians want him, and that the Treaty of Berlin provides for the free election of a Prince by the people, and the confirmation of their choice by Turkey with the consent of the Powers who signed the treaty. Should the Prince be driven out, Russia will have an opportunity to set up a puppet at Sofia, and will have a clear road for an advance on Constantinople.... There is in the Bohemian Diet a nationalist squabble that may ultimately lead to the partial disintegration of the Austro-Hungarian Empire. Of the 5,500.000 population of the country (20,044 square miles in area) 61 per cent. are Slavic Czechs, 37 per cent. Germans and about two per cent. Jews. The Germans inhabit the northernmost part of the country in compact masses and form a part of every city and town population, and the Czechs, the rest of the land. For generations there has been a bitter contest between the German and the Czech nationalities, and the hostility has been augmented by the successes of Prussia against Austria in 1866 and of Germany against France in 1870. In the Diet, composed of 241 members, the Germans are greatly in the minority, and in order to show their disapproval of the proposed legislation the German members have absented themselves since the opening of the session. The Nationalist majority has just declared that their absence is equivalent to resignation. The Germans yearn for annexation to the Fatherland, and the Czechs for independence; while Hungary is again plotting for the same object and Pan-Slavism is gaining ground in the outlying provinces of the great heterogeneous Empire..... Brazil has an area of 3,200,000 square miles and has, therefore, after Russia, the most extensive contiguous territory of any country on the globe. It is divided into 20 provinces and its population, made up of many races, is probably about 11,000,000. Of these probably one-third are whites, the remaining two-thirds being made up of mestizos, mulattoes, cafusos (a cross between Indians and Africans) and civilized and savage Indians and negroes, the last being the most numerous unmixed race in the empire. Some of the Indian tribes are still cannibals. Since 1871 slavery has been gradually done away with, and was finally abolished about two years ago. Of late immigration has been quite heavy, especially from Germany, Switzerland and Italy.....Brazil produces four-fifths of the coffee consumed in the United States and over half of all used in the world, nearly all the finer grades being sold as Java, Mocha, Martinique or Bourbon. Sugar, cattle, hides, horns, tobacco, cotton, barks, gums, india rubber, etc., are the chief other exported products of the empire. The country has splendid transportation facilities by water and of late years lines of railroad have multiplied rapidly... In 1807 when Napoleon declared war against Portugal, John VI. the reigning sovereign, took refuge with his family in Portugal's most important dependency, Brazil, and on the fall of the Corsican, in 1815, Brazil became a kingdom, John being King of Portugal and Brazil. In 1822 Brazil separated itself from the "Mother Country" and was declared an empire under Dom Pedro I., son of John, who had been regent of the kingdom. The latter abdicated in 1831 and was succeeded by his son Pedro II. who has lately become widely known as the greatest imperial globe-trotter. One of his latest projects was to arm a militia 100,000 strong as a check to the regular army 6,000 in number. The latter objected, and a fortnight ago, one of the generals revolted and proclaimed the deposition of Pedro II. and the establishment of a republic at Rio de Janeiro, capital of the empire, with a population of 450,000. Republicanism had long been steadily gaining ground, and the rest of the country quietly acquiesced in the movement. Dom Pedro, who is a sort of imperial Republican himself, quietly submitted, and having received a present of $2,800,000 cash, with an income of about $400,000 for himself and a continuance of the incomes already enjoyed by his family, he with the latter peacefully steamed away to Europe where all arrived safely and will winter at Cannes in the South of France. The new Republic has taken the name of the United States of Brazil, and assumed for its flag an imitation of ours with the Brazilian colors instead of the red, white aud blue. No Prince, King or Emperor now rules from Point Barrow to Cape Horn; though, of course, England and Holland, both monarchical countries, still have possessions on the continent and Spain owns several of the West India Islands.....

AGRICULTURAL NEWS.

SATURDAY, November 30, 1889.

THERE have been many conflicting reports in regard to widespread destitution in South Dakota. The Commissioner of Immigration says that many inexperienced and improvident people were attracted there, and many of them have made failures as they probably would have done anywhere. He asserts that while some farmers have lost two successive crops, every county of Dakota has surplus enough to supply all the destitute within its bound aries. The Governors of both the Dakotas concur in this opinion ..... The Indiana Horticultural Society will hold its 29th annual meeting at Indianapolis, December 3–5. Papers from prominent horticulturists are expected on timely topics. Space will be provided for the exhibition of fruits. C. M. Hobbs, secretary, Bridgeport.....A market gardener near Chicago makes a business of growing and shipping Hubbard Squashes to the New England markets. He has this year 30 acres of his own growing, and he usually buys hundreds of tons of other growers. The stock is stored until January or February before shipping begins. A selling price of $35 to $40 per ton is said to pay well, though as high as $80 has been received. What is to hinder some enterprising farmer from making money growing squashes on some of those abandoned farms of which we read so much?..... Last spring we mentioned the fact that the Illinois State Grange had offered a premium of $10,000 for a practical mechanical device for binding grain with straw. Several models have been submitted, but only one was deemed satisfactory. The inventor, however, declines to accept this amount for his rights in the device. The committee say that the machine does its work much better than straw-binding is done by hand, and that it is more simple and easy of operation than the twine binder.....The 32nd Annual Meeting of the Missouri State Agricultural Society will be held at Lebanon, December 3–5. An extended and varied programme is presented, liberal premiums are offered, and every arrangement has been made for an entertaining and profitable meeting..... At the annual meeting of the American Aberdeen-Angus Breeders' Association, held at Chicago, November 14th, the following rules were adopted: "Males red in color or with a noticeable amount of pure white above the underline, or on leg or legs, or with scurs, shall not be eligible to entry for breeding purposes, but the same, when reported as castrated, shall be accepted and counted under the rule requiring the castration of one in 10 males." Also that Rule 3, Section III. be amended by adding: "When an animal is a twin it shall be so stated and the sex given of the animal with which it is a twin. Should a twin be entered upon the record without such statement no subsequent application for the entry of an animal twin with the same will be accepted." The price of Herd Books hereafter will be $2 per volume, postpaid to members, and $3 per volume, postpaid to non-members ..... The Red Polled Cattle Club of America had a rather stormy session in Chicago, November 20. It is generally supposed that Polled cattle are more peaceable than those with horns, but their breeders seem to have had a considerable misunderstanding. An "incorporated," and an "unincorporated" club now put forth a report. J. Mc Lain Smith, secretary, Dayton, Ohio.....

A woolen factory fitted up with modern appliances has been opened in Athens, Greece, and will employ about 120 hands. This is the first of its kind in the country, and its opening was the occasion of much rejoicing, the inauguration being participated in by church and State dignitaries.....Michigan has shipped to Texas and the Southwest over 3,000 blooded rams the past season, one breeder having shipped 1,400 Merinos.....The wine product of California for the present year is estimated at 16,000,000 gallons, which is a slight decrease. Many wine grapes have been made into raisins.....An Albany manufacturer of agricultural implements has recently made a large shipment of his goods to Moscow for use in Asia. The agent who made the purchase made a tour of the Southern States for the purpose of studying the methods of raising cotton. The Russians it is said will engage extensively in the culture of this staple in Asia.....The proprietors of the Aztalan, Wisconsin, butter and cheese factory, who were charged by Dairy Commissioner Thom with using rotten butter to "fill" their skim cheese, threaten to sue the Commissioner for damages. They claim that they do not use bad butter for filling, but the "ordinary" country store butter much the same as most people use on their tables. .....Over 330,000 head of cattle were handled in Chicago during October....Only about 500 head of buffaloes are left on the Western plains.....Texas cattle fever is reported from the vicinity of St. Louis, Mo.....California raisins which are not properly cured are disposed of to Eastern mince-meat manufacturers..... The 7th annual meeting of the Cider and Cider Vinegar Makers' Association of the Northwest will be held at the Sherman House, Chicago, December 17 and 18. The programme will be issued about December 1. L. R. Bryant, secretary, Princeton, Ill.

Crops & Markets.

SATURDAY, November, 30, 1889.

THE November Crop Report of the Department of Agriculture gives the average yield of the corn crop as 26.9 bushels which is slightly above what is considered an average crop. The quality in some localities, is, however, below average, so that the feeding value will not be above the average.

POTATOES average about 76 bushels per acre for the whole country, while the average of the Atlantic States where 40 per cent. of the entire crop is grown, is 60 bushels of very inferior quality. The highest yields are in the States of Iowa, Minnesota, Nebraska, Oregon and Washington, Maine being the only eastern State having a good yield. In some of the States west of the Mississippi the price is as low as 15 cents per bushel, while in some of the eastern States consumers have to pay one dollar per bushel. The crop seems to be very unequally distributed. Sweet potatoes yielded considerably better the average being above 90 bushels.

APPLES were a poor crop excepting in some localities in the central western States. Not only the yield but the quality is very inferior, and much of the fruit will not keep well.

THE HOP crop on the continent of Europe is reported at three-fourths of a full crop, and one-third larger than last year. English growers report a crop one-fifth larger than last year, but the quality is poor. England will need nearly 20,000,000 pounds besides her own crop, which will come either from the continent or from America. The United States crop is estimated at 35,000,000 to 37,000,000 pounds, some of poor quality, but many excellent.

MAGAZINE REVIEWS.

LIPPINCOTT'S for December is an exceptionally interesting and valuable number. Charles Morris contributes an article on the "Power of the Future," in which he discusses the probable sources of power when the mines of coal which have enabled man to accomplish so much shall have become exhausted. Although there is no immediate danger of this occurrence, yet it is computed that the coal mines of England at the present rate of consumption will be exhausted inside of two centuries, and of course there must be a limit to those of other countries. All the heat and power contained in coal, wood and other combustibles came orignally from the sun—are bottled sunlight as it were, and to this source the author would look for the source of all power in the future. We are wont to speak of electricity as the power of the future, but we forget that electricity as we use it is only the stored energy produced by other means. French engineers have been endeavoring to make a more direct use of the sunlight as a means of power, and have so far succeeded as to run a printing press with the power obtained, which printed 500 copies per hour of a paper called the Sun Journal. The late John Ericsson had been actively engaged in experiments upon these machines for 25 years before his death, and had produced an engine which far surpassed that of the French engineers in efficiency. He continued to labor on this machine until within two weeks of his death and exacted a promise from his chief engineer to go on with his exoeriments.

"Building Associations," by Thomas Gaffney, describes the usual manner of forming and operating such corporations, more particularly in Pennsylvania, though the same principles govern them everywhere. There are about 1,000 such associations in Pennsylvania with some 218,000 members. "Fiddler Rakes's Fiddle" is a Virginia sketch by Rosewell Page, which seems to show that a fiddle is not always the evil thing it is represented. "Against his Judgment" is a study in moral heroism, in the shape of a very pleasantly written story with a very tragic ending, The complete novel is by John Habberton and is entitled "All He Knew." It is a story of an ex-convict who came back from prison "a changed man," and who lived the reformation he professed in spite of many discouragements, not the least of which were from a hypocritical deacon. The simple story and faith of this man though he couldn't understand the theology so freely preached to him, worked a wondrous reformation in his town. It is a touching story of simple faith and works as contrasted with Pharisaical hypocrisy. J. B. Lippincott Company, Philadelphia.

HARPER'S for December is well filled with a variety of matter suited to a wide range of readers. There are several articles peculiarly well adapted for a Christmas number. "A Golden Wedding" is a simple yet touching story by Ruth McEnery Stuart, the scene of which is laid in New Orleans. An aged negro man and woman living in adjoining apartments in an old hovel, combine their scanty resources for a Christmas dinner. It was a warm Christmas, and after the appetizing meal was finished, the old couple indulged in reminiscences of days long past, "before de wah," and of another warm Christmas when they were married. After a brief but happy period of married life the vicissitudes of that terrible institution of slavery separated the devoted pair, and the mother and her baby boy were lost to the fond father and husband. Ever since the war had freed him, he had been "a-huntin' fur Cicely." With changes of masters had come changes of names, but will it surprise the reader to learn that this aged pair crooning together over the remains of their Christmas repast were the long-separated Aleck and Cicely? For propriety's sake, they were "called out in church," again; this constituted their golden wedding and then they found their long-lost little Joe, now a minister of influence, with a numerous progeny of his own. "The Flight into Egypt" by Henry Van Dyke, is a reproduction of paintings of different periods representing that important event, with descriptions and comments thereon. "The Twelfth Guest" is a well-written story of a family Christmas dinner in the country, and the poor wayfarer who was entertained, though with many misgivings, proved, if not an angel, a great blessing to the family. "The Song of the Opal" is a strange, weird story of the far Southwest. Other stories are "The Taking of Captain Ball," by Sarah Orne Jewett; "Medusa's Head," by F. D. Millet; and "The First Countess of Wessex," by Thomas Hardy. Theodore Child contributes an article on "Modern Russian Art," which is profusely illustrated with numerous elegant engravings. There is also an illustrated article on the "Merry Wives of Windsor," which will delight the students of Shakspeare. Harper & Brothers, New York.

THE NEW YORK LEDGER

"THE WHOLESOME EDUCATOR OF MILLIONS."

THE LEADING WRITERS.

CELEBRATED ARTISTS.

$2 A YEAR

SIXTEEN PAGES EVERY WEEK

SPECIAL FEATURES.

Herbert Ward, Stanley's Companion.

Herbert Ward, the companion of Stanley in his explorations in Africa, is the only white man connected with Stanley's African explorations who has ever returned alive from the "Dark Continent." Mr. Ward's articles running through eight numbers of the "Ledger" are of the most intensely interesting description, and cover five years of his adventures in Africa, and they will be illustrated by sketches made by Mr. Ward, and by the reproduction of photographs taken by him in Africa. These pictures will throw much light upon the manners and customs of the hitherto unknown cannibal tribes of Africa.

The Story of a Forsaken Inn, (A SERIAL STORY) *By Anna Katharine Green.*

Life in British America, *By Rev. E. R. Young.*

Being the adventures and experiences of Rev. E. R. Young, the celebrated missionary, and his wife during their residence in the Polar region twelve hundred miles north of St. Paul, in which Dr. Young narrates how he tamed and taught the native wild Indians of the Northwest; how he equipped himself for and how he made his perilous sledging and hazardous canoe trips when visiting all the Indian settlements within five hundred miles of his home.

Honorable Henry W. Grady

Contributes a series of six articles on the "Wonderful Development of the Industrial Pursuits of the New South."

American Cookery, (A SERIES OF ARTICLES) *By Miss Parloa.*

Giving the reasons why it is imperfect, and some ways by which it may be improved.

Nihilism in Russia, *By Leo Hartmann, Nihilist.*

Leo Hartmann, a fugitive from Russian authorities, has been connected with the most daring feats of the Russian Nihilists. Mr. Hartmann shows how the intelligent people of Russia are becoming Nihilists in consequence of the despotism of the form of government. A participant in plots to kill the Czar, such as the blowing up of the Winter Palace, he is able to give true information as to how this and other great schemes were accomplished. The situation in Russia is sufficient to increase the love of every true American for our form of government.

EXTRA SOUVENIR SUPPLEMENTS.

Among these beautifully illustrated four-page souvenirs, which will be sent free to every subscriber, will be a poem by

John Greenleaf Whittier, *Illustrated by Howard Pyle.*

Written for the "Ledger" by Mr. Whittier in his 82nd year. Another souvenir will be a beautifully illustrated poem written by

Honorable James Russell Lowell.

The Ledger will contain the best Serial and Short Stories, Historical and Biographical Sketches, Travels, Wit and Humor, and everything interesting to the Household.

SWINDLES EVERYWHERE.—The only object of this department from its inception, over eight years ago, to the present day, has been to guard the readers of the paper against the multitude of swindles and humbugs of all sorts by which swarms of sharpers are constantly trying to victimize those who live in small towns and country places, because in the minds of all crooks and of several others, such people are much more easily deceived, bamboozled and gulled than dwellers in large towns and cities whose wits are supposed to be kept constantly "on edge" by friction with each other and who should be well posted on various forms of swindles by reading about them frequently in the papers. As a matter of fact, however, it is very likely that the people of towns and cities are swindled just as often and just as egregiously as country-people. Indeed, hardly a day passes without the appearance in the papers of lengthy accounts of old, old swindles successfully practiced on town and city business men who have the reputation of unusual smartness; while the people at large are swindled and humbugged so persistently that it would be too tiresome to give any account of their heavy losses, even if these became known to the police or the newspaper reporters. It is only when a large number of persons are known to have been defrauded by the same scheme and usually by the same person or gang, or where the trick is new and the losses have been heavy among a smaller number of people, that swindles on city folks are considered worthy of notice. Truly the swindler is multitudinously abroad among the people in towns and cities as well as in country places, and he takes all sorts of shapes and disguises. It was said of old that the way of the transgressor is hard; but nowadays this is true only or chiefly of the vulgar, thick-witted, law smashing rogue. How many very successful rascals now succeed in transferring their neighbors' purses into their own pockets just within the letter but outside the moral of the law, and how many in performing the same fraudulent trick break the law so gently, so quietly **and** so carefully that the fracture is hardly noticeable, and often resembles a natural flaw so very closely that a learned judge or several of them with the aid of half a dozen wrangling lawyers can hardly tell the difference?

The town swindles although essentially of the same family, usually differ in one or more features from the country swindles; but frequently the same form of fraud is equally successful in both places, although generally even then its dress undergoes some trifling changes in order that it may be in closer accordance with "its surrounding." A few, however, appeal in precisely the same shape and dress to the gullibility, greed or carelessness of town and country. Among these few land and town-site booms hold a prominent place. These are generally as loudly heralded in papers that fall under the eye of city-men as in those that are likely to be read by country-men, and a very fair proportion of the victims are among the former, especially in case of town-site booms. Indeed in a recent case of a very novel character up in Minnesota, it is probable that nearly all the losers were town-folks. Now that this form of fraud has once been started it is certain to be again utilized and probably under conditions by which farmers are likely to be among the sufferers; hence it deserves a warning place in this department.

SMART LAND SHARKS.—Lake View Division is a gilt-edged section of Duluth, Minnesota, worth from $2,000 to $5,000 per lot. Lake View Addition is a tract of 20 acres of poor land nine miles from Duluth. In September 1887 Lake View Addition was bought by speculators at the rate of $5 per acre. Eleven days afterwards the whole of it was transferred for $96,000. Two hours later, on the same day, still another transfer was recorded for $100,000, and this was followed a few days later by another deal in which the figure was $105,000. Thus in less than 15 days after the 20-acre tract of nearly worthless land had been bought for $100, it had acquired a fictitious value of $105,000! Then the sharpers prepared to cast their nets for gudgeons. Maps and diagrams of plats were widely distributed in places distant from Duluth, in which the fraudulent Addition was represented as occupying the place of the valuable Division. Then came an abundant harvest. The sharpers preferred cash; but were willing to take in exchange valuable property in Minneapolis, Chicago, Indianapolis and other cities, and a few eligible farms that could be readily disposed of were also gobbled up. As soon as the deeds were recorded the crooks would sell the property and realize handsomely. Then came a lull in real estate transactions in the bogus section; but about a fortnight ago the swindle bobbed up serenely again with a transfer of $19,500 worth of fraudulent lots. The record of the transactions was accidentally noticed by a Duluth newspaper, which at once set a special reporter to investigate the matter. He traced the scheme back to its original starting point, and found that over $335,000 worth of transfers had been recorded and mortgages for nearly half as much more had been filed. Many deeds had, no doubt, not been recorded, so that it is very likely the aggregate loss must be considerably over half a million dollars. Will the swindlers ever be punished by the law? No doubt they speedily got beyond its reach into Canada or some other convenient refuge for dishonest rascality.

BED-BUGS AND RED ANTS.—In Insect Life for October, 1889 Prof. C. V. Riley records a fact which he says is not generally known, viz:—that the red ant will destroy bed-bugs.

"One of Prof. R.'s assistants, had an opportunity at Meridian, Miss., during the war, of seeing an old building used as barracks and filled with bed-bugs, invaded by countless numbers of red ants. Several ants would attack a single full-grown bed-bug, pull off his legs and carry away the helpless body. They penetrated the closest cracks of the rough beds and dragged out old and young bugs and eggs. There is, then, some slight consolation in having the ants about one's house, but with care and cleanliness, especially at the North, there is no excuse for the occurrence of either pest."

Prof. R. says he occasionally meets a favored individual who has never seen a bedbug, but such fortunate people are rare. It is said that the pest was brought to England in 1503 and reached America soon after extensive settlement. Certain English writers try to father the pest on America, but "there is strong evidence that it was known to Aristophanes, Dioscorides, Pliny and Aristotle" (!) Most of us care but little about its origin; we are after its life. The following facts, taken from the article are interesting:

"The number of annual generations depends on conditions of food and warmth. With plenty of food and an even temperature they will multiply with great rapidity, while under contrary conditions reproduction may be greatly retarded. Adult bugs have been known to remain alive for more than a year without a single meal. It is this fasting capacity, together with its form so well adapted for hiding, which renders it so difficult to thoroughly disinfect an infested house.

Here again benzine must be our strongest weapon. Finely sprayed with a hand atomizer it will penetrate the minutest cracks, and is sure death to the insect in all its stages, including the eggs. It is a certain remedy, and used thoroughly will destroy every bug in a house. Kerosene is almost as good and is a little more lasting in its effects. Many preventives have been advised, but none are permanent. One of the best formulas for a substance with which to paint the cracks in a bedstead or the wall is one ounce corrosive sublimate, half pint alcohol, and one-fourth pint spirits of turpentine"

Those who introduce red ants for the purpose of killing bed-bugs will find that they must kill off the ants too or life will still be a burden for them. Speaking of this warfare, Prof. R. says:

"The first recommendation is to find the point from which they all come. Then see if they have built the nest in some accessible spot, in which case a little kerosene will end a large part if not all of the trouble. If the nest is in the wall or under the floor and taking up a board will not bring it within reach, find the nearest accessible point and devote your energies to killing the ants off as they appear. Where the nests are outside nothing is easier than to find them and to destroy the inhabitants with kerosene or bisulphide of carbon. The nests are almost always in the immediate vicinity of the house. The ants are peculiarly susceptible to the action of pyrethrum in any form, be it Persian or Dalmatian powder or buhach, and a free and persistent use of this powder will accomplish much."

Some housekeepers place traps for the ants. These traps are small pieces of sponge moistened with sweetened water. These are left where the ants congregate, and once a day or so, when the ants have collected on them, soaked in hot water and replaced.

CATTLE FOODS AND FEEDING RATIONS.—The enterprising director of the Geneva, N. Y. Experiment Station has given in Bulletin 17, an exceedingly valuable dairy feeding manual. It is just such information as is printed in this pamphlet that dairymen want, just such problems that they ought to study. Dr. Collier states that the average New York State cow produces less than 3,000 pounds of milk per year or less than 130 pounds of butter. Such dairying "don't pay." While proper breeding and selection have much to do in the work of improving our dairy cows, good care and judicious feeding must also accompany them. Dr. Collier gives tables showing the analyses of various grasses and grains, as well as the digestibility of these substances and the amounts of each required to make suitable rations. Added to these are a number of rations given by New York dairymen from their actual practice. Each of these rations is explained and analyzed in a way that will show the feeder just what is needed or just what should be left out.

For example, one herd of 12 Jersey cows average 320 pounds of butter per year. The daily feed for each cow is:

12 pounds Meadow hay.
3 " corn meal.
3 " wheat-bran.
3 " linseed-meal.
3 " oat-meal.

This ration is considered by Dr. Collier as very close to what American experience seems to indicate as profitable and economical. It is well worthy of study by dairymen. We would like to have every reader of the R. N.-Y. read this bulletin.

EXPERIMENT ORCHARD. SMALL FRUITS.—Bulletin No. 2 of the Virginia Experiment Station. Some months ago the R. N.-Y. spoke of the experiment orchard started at the Maryland Station. Now we have to record the planting of a similar one at the Virginia Station. We regard this as an excellent experiment in every way. Farmers of Virginia may learn some excellent lessons regarding varieties best suited to their soil and climate at this experiment orchard.

SOILS AND ALKALI.—Bulletin No. 9 from the Colorado Experiment Station. While this bulletin deals with local conditions—those peculiar to the Colorado soil and climate, it is of general interest to all who care to investigate questions pertaining to geology or chemistry.

THE PURINTON STEAM GENERATOR!

IS THE BEST ARTICLE ON EARTH

For cooking any kind of food for stock. Cooks, boils or steams anything with economy and dispatch.

Made of boiler-plate steel!
Safe, durable and substantial!
Nothing to get out of order!
Freezing does not damage it!
Easy to manage as a stove!
We sell more than all others comb'n'd
Has always given satisfaction!
It will suit you.
Investigate and you will buy no other
We also make Tank Heaters and 2-4-6 Horse Boilers and Engines

MANLY PURITY AND BEAUTY

CUTICURA REMEDIES CURE SKIN AND BLOOD DISEASES FROM PIMPLES TO SCROFULA.

NO PEN CAN DO JUSTICE TO THE ESTEEM IN which the CUTICURA REMEDIES are held by the thousands upon thousands whose lives have been made happy by the cure of agonizing, humiliating, itching, scaly and pimply diseases of the skin, scalp and blood, with loss of hair.

CUTICURA, the great Skin Cure, and CUTICURA SOAP, an exquisite Skin Beautifier, prepared from it, externally, and CUTICURA RESOLVENT, the new Blood Purifier, internally, are a positive cure for every form of skin and blood disease, from pimples to scrofula.

Sold everywhere. Price, CUTICURA, 50c.; SOAP, 25c. RESOLVENT, $1. Prepared by the POTTER DRUG AND CHEMICAL CO., Boston, Mass.

Send for "How to Cure Skin Diseases."

Pimples, blackheads, chapped and oily skin prevented by CUTICURA SOAP.

Rheumatism, Kidney Pains and Weakness speedily cured by CUTICURA ANTI-PAIN PLASTER, the only pain-killing plaster.

MASON & HAMLIN

The Cabinet Organ was introduced in its present form by Mason & Hamlin in 1861. Other makers followed in the manufacture of these instruments, but the Mason & Hamlin Organs have always maintained their supremacy as the best in the world.

Mason & Hamlin offer, as demonstration of the unequalled excellence of their organs, the fact that at all of the great World's Exhibitions, since and including that of Paris, 1867, in competition with best makers, of all countries, they have invariably taken the highest honors. Illustrated **ORGANS** catalogues free. **$22 to $900**

Mason & Hamlin do not hesitate to make the extraordinary claim for their Pianos, that they are superior to all others. They recognize the high excellence achieved by other leading makers in the art of piano building, but still claim superiority. This they attribute solely to the remarkable improvement introduced by them in the year 1882, and now known as the "MASON & HAMLIN PIANO STRINGER," by the use of which the greatest possible purity and refinement of tone, together with greatly increased capacity **PIANOS** GRAND & UPRIGHT, for standing in tune and other important advantages.

A circular, containing testimonials from three hundred purchasers, musicians, and tuners, sent, together with descriptive catalogue, to any applicant.

Pianos and Organs sold for cash or easy payments; also rented.

Field Crops.

THE SUCCESS OF A FAILURE.

The R. N.-Y. tries to produce a large crop of potatoes on a measured acre; the unfavorable season cuts off the crop, but does not prevent a profit; neighboring farmers fail; restoring waste land by the use of chemical fertilizers; the beginning of an interesting experiment.

THE failure refers to the season just closing, which is regarded by the farmers of Bergen County, New Jersey, as the most unfavorable for the potato crop that they have ever known. It is doubtful if one farmer in 10 made any profit on the crop after paying for seed and fertilizer and allowing a fair sum for his own labor, and interest on the price of the land. It is safe to say that the majority of farmers barely paid for fertilizer and seed. Under these circumstances the R. N.-Y. takes peculiar pleasure in recording an experiment with a potato crop which at least paid a profit besides affording the chance for a most interesting study. In this year of general failure, it may perhaps be considered worthy of the title we have selected for this narrative.

The two seasons before this one were both wet, and farmers confidently expected a dry summer this year. Many potatoes were therefore planted on naturally moist soil. This had much to do with the general failure of the crop.

The R. N.-Y. was particularly anxious to produce a large crop this year, and at the same time it was interested in testing the claims made by some farmers that by means of very heavy dressings of chemical fertilizers, waste lands can be restored to fertility and be made to yield a profit during the period of restoration. By this period we mean the time that must elapse before a strong sod of clover and grass can be grown and plowed under. Old farmers frequently say that they can bring any soil into a productive condition if they can have manure enough to start a strong clover sod. A later school of farmers claim to be able to take any well-located land, no matter how poor or "exhausted" it may be, and bring it to the highest state of cultivation, *making it pay a profit from the very start.* The process by means of which this is to be done was described in the R. N.-Y's. account of the farms at Cranbury, N. J. In brief, it means a five-course rotation as follows: potatoes, grain, grass two years, corn. At least a ton per acre of a complete potato fertilizer is used the first year. In an average season this heavy dressing gives a profitable crop while it leaves sufficient fertility in the soil to mature a good crop of grain and produce a strong sod of clover and Timothy. A good dressing of stable manure is to be given the sod before plowing for the corn. The R. N.-Y. started to test this system, slightly modified, on a measured acre.

The land is located at the top of a low, rather steep hill which faces the east. Like most of the farms about it, the R. N.-Y.'s New Jersey farm is long and narrow—a single field wide and nearly half a mile long. The acre selected for this experiment is in the field farthest away from the house. So far as the R. N.-Y. knows, the acre has received nothing in the way of manure or fertilizer since it was broken up about six years ago. When the R. N.-Y. bought this farm, early in 1888, a thin, light crop of rye was growing on the acre. This crop yielded considerably less than a ton of poor straw. We considered the soil very typical of the hundreds of acres of "worn-out" and practically abandoned land in the immediate vicinity. If the Cranbury system of farming will profitably restore this soil, such restoration is possible to 99 per cent. of the "abandoned farms" of New Jersey.

THE SEASON'S WORK.

The acre was plowed April 17 and planting was begun the next day. The R. N.-Y. has always advocated three strong points in potato culture:

1. Thorough preparation of the soil.
2. The trench system of planting, involving a heavy dressing of chemical fertilizers placed so as to be available all through the season.
3. A heavy "seeding" of varieties known to be vigorous and heavy yielders from a more northern latitude if possible.

Owing to various causes, it was impossible to carry out the first part of the programme as carefully as was wished. The soil was simply plowed once, worked over with a Clark's Cutaway harrow and smoothed with a wooden-toothed harrow. The next field we treat will be plowed in the fall, cross-plowed in the spring, worked for a long time with the Cutaway, and then with the Acme. In plowing and harrowing, the Sherwood Steel Harness was used. We regard this as one of the best labor-saving devices on the farm. After plowing, trenches were made three feet apart, by means of a trench or shovel plow made by the Syracuse Plow Company. Large pieces of potato, each one containing at least two strong eyes, were dropped in the trenches as nearly one foot apart as possible, the dropper kicking a small quantity of earth over each piece as he passed. A dressing at the rate of 1,600 pounds per acre of Mapes Potato Manure was then scattered through the trenches. This fertilizer was not placed directly in the bottom of the trench, but was scattered all through it so as to fairly surround the seed-pieces. The trenches were about half filled above the seed-pieces by hauling an old harrow lengthwise of the rows. As the plants appeared, the cultivator (a Higganum Horse-hoe) was started through the rows. At each working this threw a little earth around the plants and helped to fill the trenches until, late in May, the surface of the field was perfectly level. Subsequent experience with Breed's Universal Weeder satisfies us as to the value of this implement, and with next year's potato crop we shall start the weeder a week after the potatoes are planted and keep it going at intervals of a few days until the plants are four inches high.

The crop was hoed twice and cultivated five times. At the last cultivation 1,000 pounds more of the fertilizer were scattered, broadcast, on the surface, between the rows, and worked in with the cultivator. The plants at the time were so strong and large that it was difficult for the horse to get through the rows.

Eight barrels of seed potatoes were used, as follows; seven barrels of Brownell's Winner, one of the most promising seedlings ever tried at the Rural Grounds; not quite a barrel of State of Maine and a peck of Early Puritan. The latter were planted on Decoration Day to fill in a few "misses." This potato did not have a fair showing, as the "blight" attacked the vines long before the potatoes were half-grown.

THE SEASON AND THE CROP.

As was previously stated, a dry season was expected, but instead of this the wettest summer ever known was experienced. A succession of heavy rains, followed by hot, damp, "muggy," weather, gave just the conditions considered most favorable for the development of rot or "blight." Early in the season the flea-beetles attacked the vines and punctured them seriously.

It is believed that this so weakened the vines that they proved easier victims to the "blight;" in the latter part of July the vines began to turn yellow and die. In 10 days the whole acre looked as though a fire had swept over it—a mass of scorched and blackened vines. The Brownell's Winner

DIGGING POTATOES ON THE R. N.-Y'S EXPERIMENT ACRE. From a Photograph. Fig. 296.

evidently suffered worst from this premature death. This variety requires a very long growing season. It is a remarkably vigorous grower, the vines covering the field, forming a perfect mat. The potatoes were dug in October and the crop was gathered and weighed with the utmost care. It is the first time, so far as we know, that the entire product of an acre has been accurately weighed anywhere in our part of the State. We dug from the acre exactly 11,612½ pounds. In plowing the acre later, the plowman turned out 195 pounds more that had been buried by the diggers. This makes a total of 11,807½ pounds, distributed as follows:

Brownell's Winner.....	10,773	pounds
State of Maine.....	873½	"
Early Puritan.....	161	"

We did not get anything like the heavy yield we had a right to expect in the early part of the season. However, we give the facts of the experiment just as they are. It would be pleasant to figure what the result "might have been" if the season had been more favorable. We have nothing to do with that. We only know that we dug 11,807½ pounds from the acre and that they have brought enough to pay for the fertilizer, the seed, the labor, a fair rent for the land and give a profit besides. What is left of the fertilizer is still in the soil. We estimate that it will enable us to grow a good crop of oats and two crops of clover and thus fit the land for a profitable corn crop. A few yields of potatoes grown in fields near ours will enable us to make a comparative crop statement. A portion of the field directly over the fence from our experiment acre was rented to a neighbor. On one acre and a-half about 600 pounds of fertilizer were used. The product is given as 55 bushels. Over the road, on similar soil with "about 600 pounds per acre," the report is "about 50 bushels per acre." No farmer near us has kept anything like an accurate record of the yield. We have no authentic record of a crop of more than 6,000 pounds on a measured acre anywhere near us. The R. N.-Y. believes its small measure of success is due to a heavy dressing of the complete fertilizer, the trench system and the heavy seeding of varieties known to be heavy yielders and strong feeders. To judge from the experience of neighbors. if we had used less than 1,500 pounds of fertilizer and the common varieties of potatoes the crop would have represented a loss. The second application of 1,000 pounds did not help the crop to any great extent because the vines died in less than a month after it had been made. Had they lived to maturity we should have expected great results from this dressing. As it is, "it is all in the soil." We are not in the least afraid of its disappearing except to reappear in the form of grain and clover.

THE VARIETIES OF POTATOES.

Brownell's Winner gave by far the best yield. It was planted on seven-eighths of the acre and yielded at the rate of a little over 225 bushels per acre. As before remarked, it is a very strong, hearty feeder—the vines being enormous. The tubers averaged 17 or 18 to the hill. It is a late potato and should grow with us up to the time of first frost; when cut down, as ours were, there are many small potatoes. As judged by this trial—not at all a fair one—it yielded far better than Early Puritan or State of Maine and is superior to either of these varieties for cooking. In quality we do not consider it quite as good as the Rural New-Yorker No. 2; it has not the close-growing habit of that variety and is less regular in shape. It is, however, a stronger grower and sets more tubers.

THE SUBSTANCE OF THE MATTER.

The R. N.-Y. hoped to grow a very large crop of potatoes by the use of a very heavy dressing of complete fertilizer on a hungry, worn-out soil. An unfavorable season prevented this, but, in spite of all, the yield was larger than any other grown in the neighborhood. It was grown at a profit. As before stated, oats will be sown in the spring and the acre seeded to clover. Two crops of clover will be cut when stable manure will be spread on the sod and the whole plowed under for the corn crop, which will be followed by potatoes again, We will report results with the oats and clover in due season. If the experiment succeed we shall be inclined to believe that there is no farm land in New Jersey that cannot be brought up to a state of profitable fertility, and that farmers will make more money by condensing their fertilizer on smaller areas until they can produce a heavy clover sod at will. A picture of the field and the diggers is shown at Fig. 296, on the first page of this issue.

HILLING AROUND YOUNG TREES

TO PROTECT THEM FROM MICE.

Beneficial or Injurious?

Prevent Mice But Cause Ice.

"THE DOCTORS DIFFER."

THE following note called out the discussion given below it:

"It has always been considered sound practice to hill the earth around young fruit trees at this season. Now comes a friend who says: 'Don't do it!' He says the swaying of the trees in the loose earth will make a socket in which ice will form and cause the bark to die. Please tell me what you think about it?"

FROM AN OLD FRUIT-GROWER.

Many mistakes are made by applying fixed rules to varying circumstances. If young trees have been newly transplanted, there is danger of injury by the wind, if a large top has been left on them. But newly transplanted trees should have the tops so reduced, when removed, that the winds cannot stir them, especially in winter when there is no foliage on them. If, in addition to this, a proper amount of roots has been taken up with them, and they have been securely set, they will stand so firmly that no wind will stir them. The mound is probably intended to exclude mice; and if so, the earth should be compactly beaten around the stem, which will further add to the security. An acquaintance set out a large orchard in grass, and banked with masses of turf around the trees, which invited the mice between these masses of turf, and they ruined his intended orchard. Had the mounds been made of compact earth, smoothly beaten, his trees would have been saved. The careless and superficial way in which young trees are sometimes dug, where the roots are cut short, and the setting out is badly performed, with no pruning of the tops, would cause the objection made to possess full force. These remarks apply to newly set trees. If the orchard has stood longer, the trees have become firmly fixed by the new roots, and the mounds of earth about them to exclude mice, will not be disturbed.

FROM PROF. J. L. BUDD.

I have practiced the mounding of recently set fruit trees in the autumn during the past 30 years without observing the injury resulting therefrom noted by the correspondent of the R. N.-Y., yet it might happen in sections having a close, retentive, clay soil. With us the mounding is practiced for two reasons: 1. The mice often girdle newly-set trees and the mounding seems to be the only certain preventive; 2. We are obliged to use for root-grafting and budding stocks which are not perfectly hardy with us and we find the mounding an advantage while depth of root is being attained. On one occasion we mounded about one-half of a cherry orchard on Mahaleb roots when a sudden freeze stopped the work. The mounded part came through in perfect order, while the larger part of the unmounded trees were root-killed.

Storey County, Iowa.

FROM T. H. HOSKINS.

I have never before heard that hilling the earth around young fruit trees is considered good practice. I have set out many thousands, and have always left the ground level, after treading the earth firmly about the trees. A little elevation may be permitted, to make sure that the ground is not dishing. It is, however, equally wrong to allow a tree to be so worked by the wind as to make a cavity by swaying. If the young tree is tall enough, or has top enough, to be in danger of this, it should be firmly supported by securing it to stakes; but I always prefer to plant trees so small as not to require this support.

Orleans County, Vt.

FROM PATRICK BARRY.

Our practice at this time of the year is to plow among our young fruit trees and the earth gets thrown up around the trees a little above the ground level, but we never "hill up." The objection raised to hilling up by the R. N.-Y. correspondent is not so serious as he represents. Hilling is frequently done to prevent damage by mice.

Monroe County, N. Y.

FROM G. P. WHITNEY.

The practice of hilling around young fruit trees, has for years been recommended by some of our fruit-growers. The location and kind of soil vary so much that the experience of one would hardly be a good rule for all. The swaying of the trees in the loose earth forms a socket and after thawing and freezing one may find his trees set in ice instead of being protected from it. Young trees ought not to be set in sod. Should there be any in sod or by the road side, I would recommend cutting the grass around them to protect them from mice, or in case of deep snow it should be tramped about them. This should be done if the trees are small. Cut the grass around the tree and put a shovelful of earth about it and tramp it down. I have never banked trees and have lost but few either by mice or frost.

Orleans County, N. Y.

FROM J. N. STEARNS.

I have several times heard the same objection raised, but I look upon it as I do on many other plausible theories which will not hold good in practice. I have between 3,000 and 4,000 fruit trees—peach, pear, plum and cherry—planted on all grades of soil, from light sand to the heaviest clay. It has been my practice for 10 years just before the ground freezes to hill up all my young trees, and even those three and four inches through, always with the best results. In fact, experience has taught me that trees so treated are much less liable to be affected by ice than those not banked up.

Kalamazoo County, Mich.

FROM W. M. BENNINGER.

The earth should be hilled and tramped firmly around all fruit trees in the fall and if this is neglected 10 chances to one the water will settle in the loose hole and the roots will freeze to death. The hill will cause the water to run away from the tree, and will also keep the latter firm so that it will need no stake.

In the nursery row and in our young orchards we plow a furrow to the tree every fall and this is done by all successful nurserymen and fruit-growers. The earth must be leveled down in the spring. The hill also prevents the mice from gnawing the trees, as they never work up a mound for fear they will get on top of the snow and freeze. We never had any trees injured by hilling up and no pockets can form if the mounds are properly made. If pockets should form they should be destroyed by tramping the earth to the trees before freezing.

Northampton County, Pa.

FROM P. M. AUGUR.

In regard to banking up around young trees, much depends upon circumstances. As a protection against mice, when properly done, it is generally effective; but is it bad for the trees? As a rule, no; though in some cases it undoubtedly may be. I will take an average case and give my "modus operandi." I take a two-acre field and plant with first-class Bartlett pears, with very good roots, 16x20 feet apart. The work takes nearly 300 trees. I plant in May. Each tree has been so thinned out in the top that it cannot sway at all in the wind. I apply a mulch of coarse manure or coarse hay. Not a tree of the 300 fails; not one has made a socket by swaying. With such an orchard a moderate and firm banking up of the trees in autumn, on land naturally or artificially fairly well drained, is a safe and commendable operation. I have, after banking, thrown a shovelful of unleached wood ashes loosely over the cone of earth as an additional safeguard and also to secure its manurial effect. We should allow no trees in our orchards with sockets at the base. The way to treat such a tree is, first, to take out three-quarters of the branches, which ought, probably, to be done in any case, and then we should firm the earth around the base, manure well, and avoid tearing off the roots with the plow or cultivator. A loose tree in an orchard is an abomination, and should at once be made firm, or replaced by a better one. On wet land mice are not so apt to be found, and a good dressing of coal and wood ashes mixed just around each tree will probably be a sufficient protection. It is proper here to say that when trees have been banked up with earth in autumn, the banking should be leveled down in spring and if any swaying has occurred, do as above indicated.

Middlesex County, Conn.

FROM JULIUS HARRIS.

Although some fruit growers have practiced hilling young fruit trees to prevent the depredations of mice, yet my experience proves that there is more danger of trees being injured by ice when hilled, than by mice when the earth around them is left in a natural condition. I have known young peach trees to be seriously damaged and many of them killed during the winter. The sockets made by the swaying of the trees are much more liable to freeze so as to hold water when the ground is raised around the trees than when left level; therefore I am satisfied that the labor in hilling fruit trees is not only useless but damaging.

Orleans County, N. Y.

FROM I. D. BALDWIN.

I have practiced hilling around small fruit trees for more than 20 years, taking the mounds away as soon as the ground gets settled in the spring, and my trees have never sustained any damage from ice forming about them. If the work is properly done, and at the right time, water cannot stand around the trees. My soil is clay, and I wait until it is damp from late rains, then bank up eight or 10 inches, making the earth firm about the trees with the spade or foot, and very little water can get in. I bank my trees for winter protection against field mice and severe cold weather.

Washtenaw County, Mich.

FITZWATER PEAR.

EIGHT specimens of this pear, which will not be offered for sale until the fall of next year, have been received at this office. The size is shown by the engraving at Fig. 297. The color is a bright yellow with russet dots about the calyx. It ripens from November to January. The flesh is tender, buttery, juicy, sub-acid, spicy and excellent. Mr. Herbert A. Jones, of Himrods, N. Y., is propagating it for sale. Its origin is unknown further than that it is from seed brought by his grandmother or great uncle or aunt, and planted in their settlement some 40 years ago. From what country the seeds were brought or what variety the seeds were taken from is not stated.

The Orchard.

Dodging the "Yellows."

Planting Southern-Grown Peach Pits.

REASONS FOR USING THEM.

THE R. N.-Y. has, of course, known for some time that a good many nurserymen use peach pits grown on the high lands of Tennessee and other Southern States for producing young trees. The business of handling and selling these Southern-grown pits has assumed a distinct shape and increases with every year. Knowing that its readers will be glad to learn more about this means of combatting the dreaded "yellows," the R. N.-Y. herewith presents the views of a number of nurserymen who have used these pits for some years:

FROM S. & O. N. BRANT.

Would seedlings from healthy, natural Texas or Tennessee peach seeds, grown on the right kind of soil, budded with healthy buds produce healthy trees? Peach seeds or buds procured from trees which have the yellows, will produce the yellows. Peach trees which have the yellows in orchards, should be either pulled up by the roots or cut close to the ground and burnt.

This will greatly help to prevent the spread of the disease. There is no other cure for it.

Morris County, N. J.

FROM C. A. CONOVER.

IN raising peach trees my opinion is that the best natural pits that can be selected by good reliable parties, no matter whether they are from Tennessee or Western Pennsylvania or North Carolina, are what all nurserymen should use, as they will produce trees healthier, longer-lived and free from yellows. Seedlings raised from pits taken from unhealthy trees will, in my opinion, not produce healthy trees. Whenever a tree begins to show signs of yellows it ought to be cut down or pulled up. At different times where a tree has been attacked by the yellows and left to stand, I have seen that in a short time the four or five trees nearest to it became affected with the same disease. Another way to take good care of an orchard is to plow it lightly so as not to disturb the roots and then cultivate it as often as needed to keep it clean and free from grass and weeds. We in this section think that the yellows often comes from neglect, from failure to take proper care of the trees. I don't think it advisable to plant a nursery on the same ground from which trees have been just taken, or to plant an orchard on the same field on which old trees have been cut down; I think doing this is a good way to produce the yellows.

Hunterdon County, N. J.

FROM CASPER HILLER & SON.

We believe that the bud of a peach infected with the yellows, inserted in a healthy seedling, will carry the disease with it; also that the seed of an infected peach would produce a diseased seedling. We also think it a fact that a young orchard planted on the site of one that had died out with the yellows, will, in a few years, die out from the same disease. In many localities where peaches formerly flourished, new plantings, no matter where the seed may have come from, cannot be kept healthy to bearing size. It will not do to attribute this to impoverished soil. We can apply potash, phosphoric acid, nitrogen, lime, magnesia, etc., in any quantity, but it would all be to no purpose. We plant Tennessee seeds because they are likely to be more healthy than the average home-grown seeds. The seedlings planted in clean soil, and budded with healthy buds, can be grown into fine trees, but in this section they finally develop the yellows and in the course of 10 or 12 years they are worn out.

Lancaster County, Pa.

FROM ASHER HIGGINS.

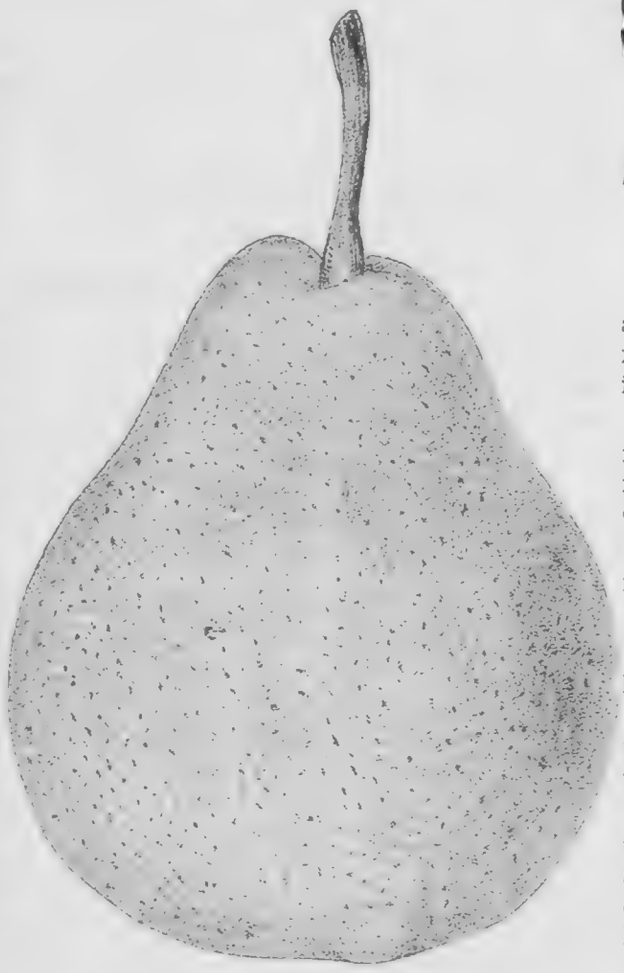
I have been in the nursery business for 20 years. I procure my pits from southern Tennessee. They are a great deal smaller and will produce a larger number of trees from the bushel than any other seeds that I can get. The trees raised from such seeds hardly ever show any signs of the yellows and are much better for planting in orchards than trees raised from inoculated pits. A bushel of good seed will make 4,000 trees.

Hunterdon County, N. J.

FROM I. C. WOOD.

We first started in about 20 years ago with natural seed procured from high grounds in Tennessee. Since that time we have procured our seed from parties who can be relied upon to furnish seed from natural seedlings. A little experience will aid one in distinguishing at a glance seeds from worked or budded trees from those from natural seedlings. My experience has been that trees grown from healthy seeds where the buds have been selected from healthy stock, will remain healthy until worn out by over-croping, lack of proper nourishment, excess of moisture or some other cause which impairs their vigor and eventually breaks up their constitution so that old age and early decline are hastened. Four-fifths of the peach trees set in this section 20 years ago are now gone because healthy trees became diseased, or because trees were raised from diseased pits, or because proper attention was not given the trees after they had been set out. It is very true that many trees have perished because they were planted in unsuitable soil owing to its being flat and underlaid with clay, consequently too retentive of water, a thing which the peach will not stand so far north as the Hudson Valley. The longevity of a peach tree raised from diseased pits depends on the stage of the disease at the time the seed was gathered, and the condition of the tree when it was set out and the treatment it received afterwards. I have known trees to show unmistakable signs of the yellows two or three years after they had been set out and to pass entirely away without ever showing a flower. Others struggle along for half a dozen or more years and produce some diseased fruit: but show a weak growth from the start. In fact, any trees that continue healthy for 10 years may, with proper attention, be kept for 20.

How can we do this? First, use healthy seed only; second, select healthy buds from trees known to be healthy. Select for the



FITZWATER PEAR.

From Nature. Fig. 297. See p. 818.

orchard a good, dry, warm soil. One year before setting the trees have the ground well plowed and harrowed; set the trees not closer than 15 feet each way—20 is still better. Plant to corn or potatoes for the first three years, leaving plenty of space on either side of the trees for breathing room. Thin out the weaker branches every season and shorten in the stronger ones one-third each season. Sow around each tree each season ammoniated bone or some special prepared peach tree fertilizer, commencing with half a pound and increasing to five pounds. After three years, grow no crops whatever in the orchard. Sow the fertilizer any time during April or May. Keep the cultivator or, what is better, the spring-tooth harrow going, say, three or four times during one season, commencing as early in spring as the ground is dry enough and, last but not least, thin the fruit. There is no one branch of the successful growing of the peach that will add so much to the value of this product and the health and longevity of the tree as this last process. In half of our trees the apparent foundation of the disease was laid by neglect of this precaution, over-cropping and insufficient nutriment. Thin thoroughly. Any handy man can earn from $3 to $5 per day in the thinning of fruit, and the operation will tend to keep the trees in a far healthier condition and add 10 years to their longevity. There is in this neighborhood an old orchard set out 20 years ago. Most of the trees are apparently in as healthy a condition as when set, and they bore a good crop of fruit the past season. Eight years ago the orchard was considered about used up. The trees had been allowed to stand in the sod for about four years; the leaves had become yellow and dropped early; the trees had grown but little for several years, and had borne quantities of small fruit. The orchard was plowed and fertilized and the sod was subdued; the trees took on new life and made a fair growth each season; the leaves became dark and large, and they hang well into the fall. The fruit is as large and luscious as it was a dozen years ago. I attribute the vigorous old age and continued health of these trees in great part to the fact that they were good healthy seedlings—in fact, if the stocks and buds had not been good and healthy these trees would have been dead long ago—still trees often die young even though they possessed perfect health on the start, because they have been neglected or some of their wants have not been supplied.

Fishkill, N. Y.

Horticultural.

Chemical Fertilizers ON STRAWBERRIES.

ANSWERS FROM LARGE GROWERS.

THE following questions were sent us by a subscriber in Maine. The answers are from well-known growers who are largely interested in the business:

1. Is superphosphate too stimulating for newly-set plants or for plants that have fruited one season? Is this true of the Crescent?

2. What is the R. N.-Y.'s opinion of nitrate of soda? of sulphate of ammonia? of muriate of potash? of ground raw bone?

3. How and when should ashes be applied to strawberries?

4. When stable manure can be bought at the barn for $4 a cord, can fertilizers be used with profit in strawberry growing?

5. After applying stable manure at the rate of 10 cords per acre, would it be advisable to use fertilizers in setting new plants or on plants that have fruited one season? If so, should they be applied broadcast or in hills, and in what amount?

6. If fertilizers are used alone, what kinds would be best; what amount should be applied per acre?

FROM J. S. CARTER.

I never grew the Crescent Strawberry and I would work carefully with muriate of potash. I tried it some years ago with fine bone, and it roasted the plants badly. Had it been worked in the soil some time before the plants were set out, it might have proved satisfactory. I have no fears of pure raw ground bone. It is a good base to work on, being slow and lasting in its effects. I would apply ashes broadcast in the spring at the time of setting the plants. I consider them safe for all crops; but they have a great tendency to bring in White Clover, which means failure with the sets the second year. I have used coal ashes in various ways without seeing the least benefit from them as a fertilizer. The difference in cost of stable manure and fertilizers, depends on the distance from which they have to be hauled and on hand hire, for fertilizers can be handled at much less outlay in time and labor. After applying 10 cords of manure on fairly good land broadcast, I would not use any fertilizer while setting the plants, unless it be raw ground bone broadcast ove the row. Yes. I would use fertilizer in the spring, if necessary, to aid in bringing the crop out. It should be applied broadcast, say, at the rate of 400 to 600 pounds per acre. I would use the fertilizer alone in setting out the plants, but prefer not to use it all at one time. I would apply, say, 500 pounds broadcast and harrow it in, and 500 pounds at the first or second hoeing, and 500 pounds more about July or August to stock and crown up the plants for fruiting. All should be applied broadcast, and worked into the soil. It should be put on when the foliage is dry, as it may burn. I use a high-grade complete fertilizer with very good results. Every one should be the best judge of the quality of his own soil, and fertilize accordingly. If it is poor, make it rich; if rich, keep it so. An application of yard or stable manure in the late fall or early winter will prove very beneficial for the following crop.

FITZWATER PEAR.

Half Section. Fig. 298. See p. 818.

Port Monmouth, N. J.

FROM CHAS. J. MAJORY.

1. In my light soil superphosphate would serve me no desirable purpose. I am obliged to use a complete fertilizer rich in potash. 2. I have never used nitrate of soda, sulphate of ammonia, or muriate of potash alone. Sulphate of potash and fine ground bone have given me very profitable returns on strawberries and raspberries. 3. I would apply ashes to strawberries in the spring as early as the ground could be worked. This is for New Jersey where I mulch strawberries for field crops. Were I in Maine I do not know whether I would need to mulch, and, if not, I would probably not work the berries in spring. In that case I would apply ashes in the fall. 4-5. My idea, based upon my own experience solely, is that stable manure at any ordinary price cannot be used on berries with profit as compared with a good complete fertilizer. I should use stable manure as heavily as possible on an old strawberry or other field to be plowed for corn, and follow with a complete fertilizer for some root crop, and then use potash and bone or a complete fertilizer rich in potash exclusively for berries. 6. Mapes Light Soil Fertilizer is excellent. A ton per acre may be applied when setting the plants. Afterward liberal quantities of Fruit and Vine Manure or potash and bone should be used.

Ocean County, N. J.

FROM A. W. WILLIAMS.

1. Plants that have fruited one season, need more stimulating than those newly set, from the fact that the year's fruiting has almost completely exhausted from the soil the elements necessary to produce a crop; for this reason I consider no fertilizer too stimulating for strawberries, the Crescent included.

2. I have had no experience in the use of nitrate of soda or of sulphate of ammonia by themselves. Muriate of potash I have used to some extent on peach trees and grape-vines, and taking into consideration the fact that the trees and vines treated by it yielded fine fruit, and produced a satisfactory and well ripened growth, I deem it one of the best fertilizers for a grower of fruits, when it is applied alternately with barn-yard manure or ground bone (pure), either of which is rich in phosphoric acid.

3. I would apply ashes (unleached) to strawberries in the fall only, if I wished results the following summer, as the action of frost tends to dissolve and disintegrate those ingredients which are naturally insoluble, and which without such action, would be many months in dissolving.

4. Barn-yard manure is indispensable to the successful grower of strawberries, and when it can be bought for $4 per cord, I think that if it is used liberaliy no other fertilizer would be beneficial, unless it might be some form of potash applied in the fall or early in the spring, in the latter case, before foliage starts. If applied later it should be brushed from the leaves with a broom. 5. After applying stable manure at the rate of 10 cords per acre, I would use no other fertilizer in setting new plants. In case the plants have fruited one year, it would be beneficial to use either sulphate or muriate of potash to increase the fruiting power of the plants, and to develop the fruit. It should be spread over the rows only late in the fall or very early in the spring. 6. Living, as I do, where stable manure cannot be obtained for much less than $5.50 per cord at the car, I use the Mapes Fruit and Vine Complete Manure liberally, believing it to contain all the elements necessary to the growth and fruitage of trees and vines. In applying it to vineyards and peach orchards I use about 600 pounds per acre, broadcasted and cultivated into the soil. It was my custom to apply it in the spring as early as practica-

ble, until the fall of 1888 when I applied it just before the ground closed. I was so well pleased with its effects the past season that I shall endeavor to use it at that time each year rather than to wait until spring, for the simple reason that in case the spring months should be dry, as they often are, the fertilizer I applied in the fall would be well dissolved and from it I should reap immediate benefit, while those of my neighbors who waited until spring to apply theirs, might not obtain the desired results and might therefore condemn the fertilizer.

Ulster County, N. Y.

The Poultry Yard.

HENS MORE PROFITABLE THAN COWS.

It is said that the profits from 25 hens equal the profits from one cow. It may be suggested that the truth of this statement depends upon the hens. Very true, but with equal truth it may be asserted that it also depends upon the cow. Taking the country at large, and averaging things, as it were, I am disposed to cast in my lot with the hens, and if any lover of the cow with a crumpled horn, or with no horns, is disposed to question my conclusions, let him take up the gauntlet or ever after give the palm to the feathered biped. Both require shelter. Buildings sufficient to make them comfortable will, of course, vary in cost as well as in architectural pretensions with the location and the taste or financial resources of the owner, but I think that 25 hens can be made snug and comfortable for less money than one cow.

Feed is quite a considerable item, but I think the 25 hens will be able to show a balance in their favor. I can keep a flock of hens, and feed them well for eggs, at an average expense of one dollar each per year. The outlay will, of course, vary slightly in different seasons and different localities, being as often under as over this amount. This would make the yearly board bill of our flock of 25 just $25. Can the cow champion beat this without starving his cow or going so near it as to reduce her milk yield? Both hens and cow must have good care, but were I desirous of the minimum amount of labor, I should prefer to care for the hens. It certainly would require less labor to gather the product of the hens' industry than to milk the cow. The droppings from a flock of hens are usually considered of sufficient value to pay for the care.

How about the product? An average hen, if decently attentive to business, will lay about 10 dozen eggs per annum. My 25 hens then will produce about 250 dozen. I can sell my eggs at an average price for the year of 30 to 40 cents per dozen, but this is too high for the country at large; 20 cents is nearer right. This makes the receipts $50 for the flock, or, subtracting one dollar per head for feed, I have a balance of $25. The first cost of the hens was probably 50 to 75 cents each, but calling it one dollar each, I have a net profit of 100 per cent. Besides this several of the hens have probably acted as incubators and thus have earned something more to be added to the credit side of the account. The first cost of the hens was less than the first cost of a good cow, so the cow must earn still more than the hens have done to make a profit of 100 per cent. Will she do it? F. H. V.

Cranford, N. J.

Everywhere.

A SUMMER OUTING IN THE NORTH CAROLINA MOUNTAINS.

III.

MARY WAGER-FISHER.

Asheville: Southern sanitation; a planter's tales; minerals; mica mines; farming; a sylvan railroad.

As there was no pressing need for us to make haste in our journeying, we settled ourselves for a week's sojourn in Asheville, for the air was so fresh and delicious that it seemed as good a place for one to grow well and strong in as higher up in the mountains. But after a few days I changed my mind on that point, for I did not like the water or the sanitary condition of the little city, which is the resort of summer and winter health-seekers from both North and South. The location is charming and the drives in every direction, the views from many points, the splendid oaks that abound and the fine horses, all go to make up a really enchanting region, under a most lovely sky. The town proper consists chiefly of one long street on top of a ridge with an electric street railway through it, while around on the adjacent hills are perched cottages with now and then one almost pretentious enough to be called a villa. But, as I have before hinted, our gracious and easy-going Southern brethren live as if utterly unaware of the causes that produce zymotic diseases and breed typhoid fevers, even in the high, pure air of the mountains.

A gentleman from Jacksonville, Florida, after he had walked over the town, said to me: "There isn't a place here that our Health Board wouldn't condemn;" but until Jacksonville was scourged with yellow fever, it didn't bother itself about drainage and house sanitation any more than Asheville was doing. Then, to add to the odoriferousness of oozing things in general, the ground at that time was covered with a carpet of 17-year locusts that were decaying after the manner of all flesh. But despite all this, the gentle breezes brought delicious air from the hills, which the presence of man had not defiled, and although the house-keeping was atrocious from the New England standpoint, and the variety of hot breads without limit, and fried chicken for breakfast, dinner and supper, threatened to become monotonous, we had a good time. The laddie climbed the mountains and brought in wonderful new flowers, interviewed our hostess as to slavery times and found out that she was glad that she no longer had to have the care of slaves, prompted the cotton planter on the piazza, who came from the Lower Mississippi Valley, to tell him his experiences in the war, and especially during the siege of Vicksburg.

This planter, who was a capital, easy-going talker, and evidently a man of unusual capacity, had considerable to say of the money to be made—and being made—in cotton culture. One Northern man had, in *one year*, paid for his plantation, having bought it cheap soon after the war. Sugar plantations were more expensive and required more experience in their operations; but in cotton there were loads of money for almost anybody who had energy and a little capital, and he wondered that any one should "go West." He admitted that the plantations were often malarious, and he might have added that no sane man from anywhere would put his health in peril, even for the possibility of making money rapidly. Some Florida people who were going North, said they had the greatest desire to eat *good* beef, as their Northern friends had assured them that Southern people who had never been North, had no idea how *good* beef tasted. There may be some truth in this, for during our week in Asheville, it was impossible for me to eat the beef served at table, which, if good at the outset, was spoiled in cooking, as it followed the fate of most Southern foods in being fried.

Asheville is 2,250 feet above the sea, and from its equable climate, it is an all-the-year-round health resort. It has no mineral springs, but it has a handsome new hotel, beautifully located, and furnished with all modern luxuries, and is filled with rich Northern parties in winter. Then there are numerous smaller hotels, and no end of boarding-houses, where one can have comfortable rooms and good board—from the Southern standpoint—for about $30 a month. Two things will suit the most fastidious—the oak trees and the sky.

From Asheville we continued our journey in a south-westerly direction over the Western North Carolina Railroad, which is still in a state of construction—a road built at great expense because of the mountainous region it threads, and a more picturesque and sylvan ride cannot elsewhere be found. The road skirts the balsam region where the conifers are in dark contrast to the lighter hues of the deciduous trees. All this region abounds both in minerals and mineral springs. It is claimed that every precious stone but the diamond is found in North Carolina. Gold mining is carried on to some extent, but the most valuable mines are those of mica. An old mica miner told me that the best mines in the State had been previously worked by a race which preceded the Indians, a clever and ingenious people of whom the Indians still bear legendary testimony. Specimens of their carving in stone are occasionally found—discoidal stones, and some fine work in amethyst. Their tools seemed to be inadequate beyond a certain point, and the mines were abandoned long before being exhausted.

The mica is found in blocks, usually, if not always, in a tilted position, and after being separated from the rock, by blasting and other processes, it is split into sheets, with a knife, and the edges are trimmed with a pair of shears, when it is ready to be packed for market. The extreme thinness to which the mica may be split is surprising. It is often as clear as glass, and, as every one knows, it is indestructible by fire, as illustrated in the isinglass in coal stoves. Latterly, the importation of mica from Southern Asia—India—has greatly diminished the profits from these North Carolina mines, the rough blocks of mica sometimes coming in the ships as ballast.

But I was more interested in the farming of this region, than in the mining, and some of it was of the most extraordinary character. Hills so steep had been plowed and planted with corn, as to make one wonder how it was ever managed without the whole outfit of man and mules tumbling head over heels into the valleys below. Now and then there were rich bottom lands in which oats, wheat, and corn throve "mightily," and the land was valued at from $50 to $100 per acre. The farm houses had a thrifty look, being often painted white; the streams were as clear as crystal, and although the land was wild and mountainous, there seemed to be unmistakable evidences that one could actually thrive there by tilling the soil, if he could manage occasionally to stand on his head!

RURAL SPECIAL REPORTS.

New York.

Forestville, Chautauqua County, November 27.—The weather for October and the forepart of this month has been extremely fine and the farmers have improved it, too. A great deal of plowing has been done, and a majority of the farmers have things in good shape for the winter. Of course, there are some who are never prepared for the winter, spring, or anything else that requires work and forethought. The grape crop of this county has been the finest ever gathered, being of good quality and bringing good prices—25 and 30 cents per nine-pound basket. It is estimated that the grape-growers of this county will receive $1,500,000 for this fall's pick. Our other fruits were nearly a failure. We had a few pears, no apples of good quality and only a few of the poor ones. Some potato-growers report success and some failure; take it all in all there is probably an average crop. Potatoes are selling at present at from 45 to 50 cents, and some for 55 cents per bushel. Newly seeded meadow and pasture lands are in excellent condition. The prospects are good for a fine cut of hay the coming season. Hay is being bought and pressed in the barn for $9 per ton; straw for $6 per ton.

I have tried the Japanese Buckwheat and found it to be a good yielder, but I cannot sell it to millers. They say it does not make good flour and does not yield as much per bushel as the other kinds. How is it with my brother farmers? I would like to hear from those who have tried this variety.

C. H. F.

THE FARMER'S CLUB

ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see if it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.]

ARE FARMERS' INSTITUTES ABOVE CRITICISM?

Several Subscribers.—Most of the reports of farmers' institutes are quite enthusiastic in praise of these meetings. Is it possible that the meetings are above criticism? What do practical farmers think about them? Is there any way of finding out?

Ans.—Yes, there is a way of finding out. In answering such questions the R. N.-Y. goes straight to headquarters. We have a list of farmers who attended the institutes in New York State last winter. To a number of these farmers—names selected at random— we sent the following note. "1. On the whole, did you get enough good out of the farmers' institutes you attended to pay you for going? 2. What topics were you most interested in and if you were to go to another meeting what subjects would you like to have discussed? 3. What was there about the institutes that you did not like and what can you criticise? We shall be glad to have you tell us, frankly, what you can about these meetings."

We did not know the parties to whom the letters were sent; we simply took them to be fair representatives of the farmers who made up the audiences. The following replies give the substance of the matter.

FROM D. W. MOORE.

1. Yes, I think I did, I only had 24 miles to go. 2. I have not kept a list of the topics and cannot well answer. I was very much interested in "bee culture" and "the fattening of hogs." Were I to go to another I would like to learn, first, how to make farming pay; second, how can we afford to hire help at the present wages and the present prices of farm products; and third whether the prices of farms and farm products are likely to go up or down within the next few years. 3. I have nothing to criticise.

Niagara County, N. Y.

FROM S. B. HARLOW JR.

1. Yes. 2. Stock breeding and feeding and any subject bearing on *practical* farm management. 3. I desire to criticise some of the speakers for giving beautiful essays on "The Home" and kindred topics; for bandying small jokes between themselves, giving the impression that they were having a very pleasant outing; for evading questions which they did not appear to be able to answer instead of saying "I do not know," and for exhibiting an unwillingness to answer direct questions. To be more particular, I will express my own opinion of some of the speakers I have heard. Secretary Woodward is full of solid meat and uses much wisdom in conducting the institutes. Seth Fenner I heard read a very good paper on road-making, but in a discussion on the topic he showed a love of jokes and repartee very much out of keeping in a school. F. D. Curtis is no doubt well posted on his subjects and is a very fluent talker. He was much displeased at being questioned and was rather sarcastic and funny by turns. He has a much greater amount of assurance than some of the farmers, who have experimented on some of his theories, would give him credit for. Charles A. Green might have told how to grow fruits; but, instead, he gave us an illustration of how farmers' wives get dinner for 10 men and care for babies when it is hot weather and Mr. Green makes an unexpected visit.

I heard Professor Bailey tell what he knew in his speciality in a way that could not fail to instruct. Prof. Roberts never says a foolish thing; he certainly is an instructor in the largest sense of the word. A Mr. Ives, from the western part of the State, spoke on horse-breeding; but his knowledge seemed to be all incorporated in his paper. Col. Woodward, of Pennsylvania, is a good speaker and a man of much practical sense. Mr. Powell, of Canada, is an instructive speaker and, better yet, is an excellent man to answer questions. The ladies I should not miss if they were dropped from the lists.

Cayuga County, N. Y.

FROM THOS. HUNTER.

I attended only one of the meetings and was present at that only a part of the time, so that I am not a great authority on the matter from my own experience; but I talked with a great many farmers who had attended the institutes and I found them, almost to a man, highly gratified with the information they received. I am certainly in favor of keeping them up. I would recommend as one topic for thorough discussion "the breeding of good stock in place of scrubs."

Cayuga County, N. Y.

FROM CHAS. E. SHAFER.

I enjoyed the institute held at Brockport very much, and was well paid for attending every session. I was very much interested in the subjects of dairying, stock-feeding, ensilage and potato-growing, and in fact in all. I would like to hear discussed, first, what shall farmers do to protect themselves from the great syndicates that are devouring them; second, what can we do to avoid the yellows in peach trees.

Niagara County, N. Y.

FROM R. S. CHAPIN.

1. I attended the institute at Canandaigua, and in some respects was well pleased, and for younger members I presume attendance was a profitable investment. 2. I should think farming interests are more vitally affected by interest on debts and mortgages and taxes than by all other things combined. Certain it is that agriculture can never prosper and pay nine-tenths of the taxes while the government is loaning its millions to the banks free of interest. I think that there must be a radical change, or farming in the older States is doomed. There was nothing in particular in the institute, that I took exception to as far as it went, but it did not reach questions of the highest importance, in my estimation. I think money should be loaned on at least one-half the assessed value of good farming property at as low a rate of interest as banks pay for it.

Ontario County.

FROM E. W. STANCLIFF.

1. I attended both the county and State institutes and think it profitable to attend. 2. I was interested in silos and silage, growing crops for fodder and handling milk for butter and cheese, growing and digging potatoes, etc. 3. I have no criticism to make on what Secretary Woodward said, but our farmers tell too large yarns.

To explain a little about those yarns: Last week I examined a neighbor's silage (his silo was only one thickness of hemlock plank matched together) and the silage (he was feeding off one-half of it) was rotten for six to 12 inches all around next to the planking. Now we were at our county institute last Saturday and he told the people in the meeting how he had put up his corn and that it was sweet silage and the stock liked it. We saw it before his cows left it and men with me called it poor stuff.

Erie County, N. Y.

FROM R. L. COOLEY.

1. I can answer emphatically, yes. 2. Profitable dairying, the caring for stock, the combining of cattle foods so as to make or form perfect rations, also the construction and uses of silos and the growing of various forage plants. 3. I have no criticisms to make except that more attention should be given to the subject of bogus products, especially butter and cheese and the adulteration of foods.

Niagara County, N. Y.

FROM HIRAM GREGORY.

I attended the farmers' institute held at Lockport last January. 1. I think I did. 2. Fruit in all its departments. Of course, it is interesting to listen to discussions on dairying, bee-keeping, stock-raising, etc., but fruit-growing is my special subject of interest. 3. I choose to criticise nothing.

Niagara County, N. Y.

FROM SAMUEL MC BLAIN.

1. I think I am safe in saying that I never attended a farmers' meeting that I enjoyed so much or by which I felt so much benefited as the institute held at Geneva. The speakers seemed to understand the subjects under discussion and earnestly discussed them from their standpoint. 2. I am a farmer. I raise fruits of all kinds; also wheat, barley, oats, corn and grass. I also feed stock of some kind in the winter, for market. The speakers could hardly hit me amiss. 3. I would hardly be justified in criticizing what I could not improve. I have no doubt that arguments were used at that institute and statements made that time will refute; but that I hold was not the fault of the speakers. Theory is one thing; actual work is another. What looks reasonable may not be practicable. If I should criticise anything it would be the tendency to extravagance likely to result from following some of the suggestions made, especially by young farmers.

Ontario County.

FROM W. H. DE PEW.

I attended the institute at Auburn part of one day and enjoyed it very much. I am only 22 years of age and am working my father's farm. I thought the speakers were almost too scientific for any one of my attainments, although I take a great interest in farming.

Cayuga County, N. Y.

COAL ASHES ON LIGHT SOIL.

One of our subscribers in New Haven, Conn., says he can obtain large quantities of coal ashes. His soil is light and sandy. He has observed that coal ashes with water form a compact and sticky mass, and argues that if they could be well worked into his light soil the result would be that it would become more compact, more retentive of moisture and better able to withstand drought. Is he right?

FROM PROF. S. W. JOHNSON.

The inquirer is quite right. The hungry, coarse-textured soil of the plain upon which New Haven, Connecticut, is situated is at once improved by a liberal dressing of coal ashes, and many acres that I remember to have seen lying for years barren of any useful vegetation and used as dumping grounds are now fruitful gardens and in many cases the coal ashes have mostly done the business.

New Haven, Conn.

FROM DR. PETER COLLIER.

I believe the subscriber will find an application of coal ashes, upon such light sandy soil as he describes, to be beneficial. I presume he need not be cautioned against applying them so abundantly as to form a sort of concrete, as they will do when used for walks.

Geneva, N. Y.

FROM PROF. E. W. HILYARD.

If the soil referred to is coarse and leachy, the ashes might have a beneficial effect in correcting the condition of the soil. If, on the other hand, his light soil is itself a fine silty one, the improvement brought about by the ashes would probably not be worth the cost of application, as they bring nothing in the way of useful mineral matters with them. I am using such ash with advantage in a heavy "adobe" or prairie clay on my premises; it renders that soil more open and tillable, and *diminishes* its cohesion, thereby conferring a real benefit. There is, of course, some difference even in coal ashes; the light, fluffy sort is rarely of any benefit, while heavy red ash may add materially to the moisture-capacity of the soil, and usually also brings with it some useful ingredients. But if your subscriber has any clay marl within easy reach, that will pay him better than coal ashes.

Berkley, Cal.

FROM PROF. F. H. STORER.

There can be little doubt that coal ashes judiciously applied to many sands and sandy soils may permanently improve them, both by increasing the power of the land to hold the water which falls upon it as rain and by enabling the soil the better to suck up water from below, but it may well be questioned, in this country of cheap land, whether any farmer can afford to expend the labor necessary for moving the ashes for the sake of the hoped-for improvement: in any event, the economic gain would probably be but small. In case, however, the problem of your correspondent should happen to fall within the domain of landscape gardening, that is to say, if he has in view the tidying up of an unsightly lot so that useful grass may be made to grow upon it in the place of unsightly weeds, it may, of course, well be worth his while to endure the inevitable sweat of the face in order to please his eye.

COMPARATIVE VALUES OF HERD'S GRASS AND ORCHARD GRASS.

L. W.-P., Cornwall, Vt.—1. What are the relative values of Herd's Grass and Orchard Grass? 2. Who is a reliable hay commission merchant?

ANS.—1. In reply to our questions one of the largest hay dealers in the city writes as follows:

"There is a difference in price, as a general thing in this market, between Herd's Grass and Orchard Grass, of from $1 to $3 per ton. Orchard Grass is raised in small quantities comparatively and is not a market grass, and it matures much earlier than Herd's Grass, and at a time when work is crowding the farmers, and the attention is not given to it that is given to Herd's Grass. It is also too coarse for a good market hay, and does not bale up or show to as good advantage as Herd's Grass does. Then again, as Orchard Grass grows very rapidly, it does not seem to possess the feeding qualities that the other grass does. All in all, it is a grass that is but very little known in this market, and not much sought after."

This is the hay dealer's side of the matter, speaking from a standpoint of marketing values entirely. A great many farmers like Orchard Grass notwithstanding its acknowledged faults of growing in tufts or bunches and early maturity. A. W. Cheever, excellent authority on practical dairy matters, considers Orchard Grass "the perfection of dairy cow fodders" when cut and cured just at the right time. It is evident that the grass will not compete with Timothy in the hay markets. Like clover, it is a grass to be fed at home. 2. F. Williams & Co., New York, are reliable.

FERTILIZER FOR SWEET POTATOES.

W. D., Burlington, N. J.—The R. N.-Y. has a great deal to say of potash as one of the principal plant foods for white potatoes: what is the principal plant food for sweet potatoes?

ANS.—The chemists state that sweet potatoes differ but slightly in the composition of their ash or mineral ingredients from the Irish potato. The percentage of ash in either kind is about one per cent.; organic combustible matter about 25 per cent.; and water 74 per cent., or about two-thirds their total weight. It is in the composition of the organic matter that the sweet differs most from the Irish. It contains more sugar (some seven per cent.) and less starch than the Irish. The points of difference are mainly in the materials, which are derived from the atmosphere and water instead of from the mineral ingredients of the soil, and are due to radical differences in methods of growth, feeding power, and surrounding conditions. It is therefore, natural to suppose that a fertilizer that gives good results with "white" or "Irish" potatoes would prove excellent for sweet potatoes.

THE DUCHESS GRAPE.

H. E. M., New York City.—Is the Duchess grape hardy and productive? Is it subject to blight or rot? Can it be easily propagated and will it grow in a "strong" soil where the Delaware will not? I wish to plant about 200 vines in New Jersey; will they be likely to do well there?

ANS.—The Duchess is a variety excellent in some places, worthless in most places on account of mildew and rot. Our inquirer will probably find that it will not be of any value. We are not aware that it succeeds in any part of New Jersey.

Miscellaneous.

W. C. C., Freehold, N. J.—Van Tassel & Kearney of this city handle good horses.

S. W. B. Ladona, Pa.—You can get broom-corn seed of W. Atlee Burpee, Philadelphia, and probably of any other seedsmen advertising in the R. N.-Y.

F. M., Naples, N. Y.—What are the good and poor points of the Moyer Grape?

ANS.—The R. N.-Y. has never tried it. Opinions as to its merits differ widely.

S. H. W., Weston, Mass.—Is the Gainor Blackberry early, medium, or late? How will it compare with the Synder?

ANS.—It ripens with the Kittatinny. The berry is larger and of better quality than the Synder; but the vine is probably not so hardy.

J. H. K., Pompey, N. Y.—From whom can I get information about abandoned Vermont farms which are for sale at $5 per acre?

ANS.—Write to A. B. Valentine, Commissioner of Immigration, Bennington, Vermont, for a list of the farms and prices.

E. (No address).—Where can I get information with regard to the history and varieties of our cultivated cherries? I would like to become acquainted with about all the literature on the subject.

ANS.—Consult Downing's "Fruits and Fruit Trees of America" and the "Origin of Cultivated Plants" by A. De Candolle.

R. F., Newcastle, Ontario, Canada.—What is the best rule for measuring hay in a stack or loft?

ANS.—Hay dealers allow 512 cubic feet to the ton. This estimate is considered fair though of course much depends upon the size of the stack and the character of the hay. Find the number of cubic feet in the stack or loft by multiplying length, hight and width. Then divide by 512.

C. E. C., Marietta, Ga.—Can the R. N.-Y. give me a little information about the taxes and government of the Bahama Islands?

ANS.—What particular information do you desire? The consular reports from the Bahamas make no reference to government and taxation, though very full regarding their commerce and trade. Tell us just what you want to know and we will obtain full information through the State Department.

L. S., St. Catherines, Canada.—My garden embraces 15 acres and in spring I intend to set out a quantity of asparagus roots. Most growers say plants should be in rows three or four feet apart and from one to two feet apart in the rows. Wishing to grow as many as possible on the land, would it not be better to plant in old-fashioned beds, having rows 15 inches apart and plants 12 inches apart in the rows?

ANS.—By *all means*, plant at the greater distance, if you would have large, tender shoots and a long-lived plantation.

"Farmer's Wife," Mount Pleasant, Iowa. How does Mr. Terry of Ohio, make such a good living on 50 acres of land? Does he have a bank account to fall back on?

ANS.—Mr. Terry claims to make his money at farming. His cash crops are wheat and potatoes. As we understand him, he has paid for his farm and built new buildings out of the proceeds of his farm. Mr. T. writes a good deal for the agricultural press and does considerable work at farmers' institutes during the winter, but the money received for this work is but a small "drop in the bucket."

Discussion.

CALIFORNIA LANDS.

C. H. S., NILES, CALIFORNIA.—A great deal of harm has been done to California by nomadic land speculators and by the class of newspapers who sell their reading and editorial columns for advertising purposes. Every thoughtful man on the Pacific Coast is in sympathy with the efforts of the RURAL NEW-YORKER to state facts, all the facts—nothing but the facts—in regard to every section of country. Now I travel a good deal over California, and visit many parts of the State. I know many of the prominent farmers and fruit-growers and often discuss crops and land values with them. Some of my own conclusions may therefore be of interest to the RURAL NEW-YORKER readers. "Comparisons," in this connection, appear to me "odious." California is very different from New Jersey, but I do not see why the New Jersey farmer should not love his home as much as the California farmer loves his; I cannot but believe in the general law of compensations, which comes nearer to balancing things than the man who has "land out West" to sell is willing to admit. So I have no comparisons to make, and only a few results of observation to give readers of the R. N.-Y.

California is a very large State on the map, and it is even larger in point of variety of climate, of soil, of resource, of social surroundings, and, in brief, of social "opportunities," large and small. It is especially and emphatically true of California that no man can afford to invest here without spending several months in going over the entire State, not merely a small portion of it. There are large farming communities in California—there are whole valleys and even counties that have never had the unfortunate experience of a "boom," that contain no real estate "boomers," and where property has always changed hands on the basis of productive values. I visited Southern California at the beginning of the great land speculations there, again at the hight of the fever, and a third time after the end had come. I noticed several remarkable things: In the first place, there were not enough boomers and buyers to cover the whole territory. Lands of the finest quality, in small districts and in the midst of excited districts, staid at ordinary rates. Buyers did not go there because the country was large and they did not hear of these districts.

A real estate man offered me orange land in one of the most famous colonies for $1,000 an acre. "But," I told him, "I know all this country, and within 10 miles in district 'so and so,' I can buy the same soil, in as good a climate, with more water, for $150 an acre." I had known him for years, and he acknowledged the truth of my statement. "But," he said, "there will never be any boom over there: we can always keep it here." It was just the same in the grape, the corn, and the wheat districts of Southern California. Communities where prices of land remained almost unchanged during the land excitement, went on calmly planting and developing their resources. The worst feature in the land excitement was in the numerous "paper towns" that were laid out in most absurd situations. Nearly all the buyers bought to sell again as soon as possible, not to build or improve, and many never saw the towns or cared to see them. The effect on the

Miscellaneous Advertising.

"Herbrand" Fifth Wheel for Buggies

country surrounding these paper towns was to cause a sudden neglect of the orchards, gardens, vineyards and fields. Every adjoining farm, it was thought, would soon be demanded for town lots. Now all this is changed; the best thing that ever happened to the southern counties was the departure of the nomadic land boomer.

The books about California are, as a rule, very hasty sketches. They are full of curious blunders. I open one famous traveler's book and there is a page of moralizing upon the strangeness of finding a stage station in Monterey named "Plato," after the Greek philosopher. If the famous traveler had looked out of the window at the station he would have discovered that it was an old Spanish town, and that the name in letters a foot long was "Pleito." A small matter? Perhaps so, but when in the next chapter the author talks of land values in California, and tells the biggest stories he has heard, the same lack of observation underlies the whole structure.

In fact, there are all sorts of lands, all grades, at all prices, in this great State of California. It is a very mountainous State—a Palestine on a large scale. Even the immense valleys of the Sacramento and the San Joaquin contain vast, rolling expanses. The "foothills" are the most characteristic feature of the State; there are cheap lands, and abundant room there. There are timber lands, reaching up to a hight of 8,000 feet above the sea; there are swamp and overflow lands about the lower courses of the rivers and the edges of the bays; there are hundreds of small mountain valleys; there are high plateaus as yet uncultivated. Prices of land vary so much that no one would risk attempting to tabulate them. A friend of mine bought 160 acres in a northern county, all fit for the plow, for six dollars an acre, went on it, and is doing well. At $25 or $30 there are hundreds of tracts in the market, some under water ditches, some in regions where the rainfall is abundant. Level valley land within 30 miles of San Francisco can be bought for $300 per acre, and that price is willingly paid, when a piece comes into market, by the farmers of the neighborhood.

For five years I have watched a process of healthy and steady settlement going on all over California, and entirely disconnected from a "land boom." It can be defined as a new development of the State by families who have come here to stay. By far the greatest number came with small means and have obtained cheap land from the government, the railroad, or by buying out pre-emptions. Some of them have settled so far up in the mountains that they live in a winter climate as cold as that of northern New York, and they are as much interested in Dr. Hoskins's articles on his Vermont orchard and garden as if they were in New England instead of California. To my mind, these poor but energetic settlers who are opening up new parts of the State, reviving the old mining counties, and making "small beginnings" are more valuable to us than men who build $50,000 houses. I have purposely avoided any discussion of the higher-priced lands of California, for so much has already been said on that subject that it may well rest for the present. There is plenty of land in northern, central, and southern California for sale in first hands at reasonable rates, varying, of course, according to soil, situation, and climate, but the buyer, as I have said, should first become familiar with the entire State.

MORE ABOUT THE COST OF LIVING.

G. A. H., BELLEFONTAINE, OHIO.—I will add my item to the facts already drawn out by this discussion. The exact cost of living on a farm cannot be fully determined because so much is consumed that is raised on the farm and of which we take no thought. Should we buy all that is consumed, or keep an account of its cost, the result would almost frighten a farmer. If this could be done I think we could more fully realize the independence of the farmer so far as eating is concerned. When we need potatoes our good wife goes to the patch or barrel and gets what she needs. If apples or fruit of any kind are needed she takes them from the farm, never thinking of pay. Chickens and turkeys, cream and butter, milk and honey are all home-raised, and we might go through a long list of other things of which no account is taken because they are produced at home with little outlay of money care or labor. Having for 20 years or more kept an accurate account of all sold off the farm and all bought, I can give a correct account of what we buy for the household use. Our family consists of myself, wife, two daughters, over 18 years, and one work hand who boards in the family and is here all the time, making his home with us. Take the year 1888, as the expenses then will come the nearest to the cost of living at the present time. Indeed the outlay has varied but little from year to year, the difference depending almost entirely on variations in the prices of the different articles bought. Our wheat is ground at the mill and 40 bushels will keep us and pay our toll. Our meat is fattened on the farm, and $50 worth is sufficient. Dry goods, including all the clothes bought for the family, will amount to $60 per year; groceries, except sugar, $17; sugar $12; shoes $15; coal-oil $4.00. We use two wood stoves in the winter and one in the summer, and burn about 40 cords of wood which sells here in the woods, cut and corded, for $1 per cord; but it cost me only the outlay for cutting, which is 60 cents per cord—put the moneyed outlay for wood at $25 therefore, then our account would stand thus:

Flour	$30.00
Meat	50.00
Dry goods	60.00
Groceries	17.00
Sugar	12.00
Shoes	15.00
Wood	25.00
Coal-oil	4.00
Total	$213.00

In the bill for dry goods is included the price of a suit of clothes costing $28, for myself, which will not occur again in five years or more. The sugar bill is small where so much fruit is used and especially canned fruit. The outlay is cut down by the use of maple sirup, as we have a sugar orchard of 800 maples and use on an average, 15 gallons of sirup much of it being used in sweetening fruit. Taking all things in consideration, the above is a fair estimate per year.

IN DEFENSE OF ENSILAGE.

H. S. W., OCONOMOWOC, WIS.—In the R. N.-Y. of Nov. 2, page 727, A. T. J. gives what would seem to be from his experience, weighty reasons for discontinuing the use of the silo in feeding for milk to be shipped for consumption in cities, but as there are large numbers who feed their cows silage and ship their milk as he does, without meeting with similar objections, must it not follow as a logical sequence that there was about his silage some peculiarity that caused the milk from cows fed on it to give forth so offensive an odor? He does not describe his method of filling the silo—whether it was done rapidly with immature fodder, without allowing time enough to elapse between fillings for it to heat, thus making sour silage, which would be very apt to impart to milk the odor which he describes; or whether his silo was filled with well-matured corn between the dough and glazing stages, which would have produced sweet silage, whether the filling was rapid or slow. Such silage when well settled and cured makes a feed that will not taint milk or cream with any odor that the most fastidious would object to. While I do not ship milk to the city as this correspondent does, I ship cream over about the same distance, and this is the tenth year in which my cows have been fed on silage, and silage alone (for roughage), during the winter months, and I have never had a complaint. I have been tempted to write this because if the trouble this correspondent experienced be capable of a satisfactory explanation, it should be given; otherwise many who would greatly profit by adopting a system of feeding that cheapens production by one-half—to put it moderately—might be deterred from being benefited by it after reading his communication. He speaks of having been "seized with the silo fever while at its hottest," as though it had since cooled down; but I opine that it is a fever that grows hotter as the years roll on, and one that will continue to do so until every intelligent farmer in the land has caught it.

KILLING SMUT IN WHEAT.

H. B. T., WALLULA JUNCTION, WASHINGTON.—I was raised on this coast and I have often wondered why so many of the farmers of the Eastern and Middle States were so long about finding a remedy for smut in wheat, (and the same remedy I have heard is equally good for oats.) Ever since I can remember seeing wheat grow—over 30 years—I have seen this remedy used for smut in wheat. It is one pound of blue vitriol dissolved in a wooden bucket of hot water with enough cold water added to thoroughly dampen seven or eight bushels of wheat. The wheat should be placed in a large, tight vessel; add the water and stir the wheat thoroughly. If allowed to remain until dry, all the better. I know many farmers who use vitriol and sow immediately, but more or less smut can be found in their crops. I have a little seed wheat that was treated with vitriol two years ago, and I will warrant that every kernel that is not cracked will grow. If any readers of the R. N.-Y. are troubled with smut I think they will find this remedy an entire success.

Eastern Washington and Oregon have, I think, had the poorest wheat, barley, oat and potato crops this year ever known. The fruit crop was splendid and brought high prices, being shipped as far east as Minneapolis.

SQUIRRELS AS RAT TRAPS.

G. G. GROFF, M D. PENNSYLVANIA STATE BOARD OF HEALTH.—From practical experience with red squirrels, I consider them only a little less objectionable than rats about a barn. Not only will they eat corn, but they will carry off and hide much more than they eat. Besides this, they gnaw buildings as rats do, and, worst of all, they destroy all birds' eggs and young birds in the orchard and lawn. This I have observed for years, as I have a grove of 10 acres near my house, in which no birds at all are reared on account of the squirrels. I cannot therefore accept Prof. Cook's rat trap. To avoid rats, have no place where they can find shelter. To drive them away, secure a drove of cats. They will leave in a little while if there are six or eight cats about a barn.

CHEESE AND RETAILERS.

JOSIAH SHULL, SECRETARY N. Y. DAIRYMEN'S ASSOCIATION, ILION, N. Y.—I indorse every word of what Prof. Wing says on page 788 concerning N. Y. State cheese, except the clause: "The retail grocers of Little Falls and Utica would in all probability be selling Canadian cheese." They would retail everything that would not answer for the best market. They want something that can be bought at a low figure, and which they can then sell at full prices. If they would not cut anything but the best grade of goods, probably four times as much would be used as now is; and in this case they could cut and retail for two cents above the cost, cut three cheeses where they cut one now, and consequently make more money than they now do.

NO POTATO BEETLES HERE.

B. T., MAPLE, SAN JUAN COUNTY, WASHINGTON.—Some time ago I saw a paragraph in the R. N.-Y. saying that the only place free from potato "bugs" was some district in Eastern Canada; but I can inform readers of the R. N.-Y. that there is in the United States a country freer from the pests than any part of Canada. In San Juan County the potato "bug" was never seen, and potato balls grow to perfection. Indeed I don't think the "bugs" have been found in any part of the Puget Sound country. I have lived in it nearly seven years, and traveled over a good share of it, and have never seen or heard of a potato "bug" here yet.

SOUR MILK FOR POULTRY.

C. A. B., FEEDING HILLS, MASS.—I see some of the readers of the R. N.-Y. advocate sour milk for poultry and some speak very strongly against it. I have fed it for years (buying of the Springfield Milk Association at two cents per gallon) and always with the best of results. For young chicks there is nothing so good as corn-meal mixed with sour milk, and allowed to stand over-night in a warm place, when it will be light and foamy like bread dough. I never have chicks sick with gapes or anything else when fed with it.

WEIGHTING A SILO.

CONNEAUTVILLE, PA.—I cover my silage with paper after it has reached a proper heat; then I put eight inches of sawdust on top of the paper. I have just opened my silo and find the silage the best I have ever had. I have sweet silage this year. I intend to cover my silo another year with dried swamp muck or peat in lieu of sawdust and then I will utilize as much as I can of it with manure as an absorbent. I think this plan will work well.

E. B. G., MANCHESTER, PA.—In a late issue the R. N.-Y. says: "The white grape Antoinette (Miner) seems to be little known. It is one of the hardiest varieties grown at the Rural Grounds and its quality is better than that of the Concord." The R. N.-Y. is right, and it is better too than a score of later introductions. I have often wondered why more was not said about this excellent grape. Are we not all too prone to let good enough alone, especially in fruit, and always on the alert for something new of which we know nothing, and which will eventually end in disappointment? Score one more for the "Antoinette."

W. A. M., AMHERST, MASS., CREAMERY.—We have tried no test of cream beyond occasional sampling by gatherers, trusting only to watchfulness on the part of the latter, to protect us against poor cream. Directors and patrons would welcome payments based upon the amount of butter contained in the cream of each, unless the tests cost so much that the receipts even of those who have the best products would be materially lessened by the outlay needed to make them.

What Others Say

THE INDIA RUBBER TREE.—The "India Rubber" or "rubber plant" is a familiar and cherished object in many houses. There is not, probably, a plant among those which, during the last 25 years, have become really popular for the embellishment of living-rooms and conservatories, which is better suited for the purpose; and there are few persons now who know anything about plants at all who are not familiar with the straight stem and splendid great, dark-green, lustrous, leathery leaves of the "rubber plant," which seems able to resist, with impunity, darkness, neglect and drought, and even an atmosphere vitiated by the gases from burning coals. Plants more than 10 or 12 feet high are not very often found in our Northern cities, and few people, perhaps, who see one of the plants flourishing year after year in the narrow quarters of an ordinary-sized flower-pot realize that it belongs to a race of veritable giants, or that the Ficus elastica, as our common "rubber" plant is called by botanists, is, in its native countries, a marvel among trees. So says Garden and Forest.

Ficus elastica was cultivated in England as early as 1815, and whoever first thought of using it for house decoration made a happy hit. It is really a fig and produces little figs precisely similar in structure to the figs of commerce.

Griffith describes a tree 100 feet high, covering with its branches an area of 610 feet, the main trunk 74 feet in girth, while the trunk with its supplementary stems was 120 feet in circumference. This species of fig, like many others found in the tropics, is an epiphyte—that is, the seed from which it springs germinates upon the trunk or branch of another tree. The young plant sends down roots to the ground, and as these grow they gradually smother the host-plant, and form an upright stem which in time becomes the support of the fig-tree. The fruit of this species, which is probably never seen outside of the tropics, is ovoid, about the size of an olive, and greenish-yellow in color.

Ficus elastica is a favorite ornamental tree throughout the tropics, and is largely used in the East Indies for shading avenues, for which purpose its wide-spreading head admirably fits it. It is cultivated in Assam, where large plantations of this tree have been made in recent years, for the caoutchouc, which it yields in large quantities.

FEED FOR DAIRY COWS:—William Crozier, the well-known dairyman of Long Island (N. Y.), says, in the Albany Cultivator, that he does not feed silage; his feed consists of cut corn-fodder, pulped mangel-wurzel, bran and ground oats. This is cut, pulped, and the coarse bran and ground oats, with some fine salt, all thoroughly mixed together. He cuts on Saturday enough to last to next Saturday, or one week. It is put in one heap on the barn floor, and covered over with a piece of old sail cloth. The mess soon warms up, though not so as to become *hot*. Each cow gets a bushel-basketful of this, morning and night, and when a cow is in full milk, or fresh, she gets one pailful of warm water, with three quarts of bran and one quart of ground oats mixed in the water, twice each day. His cows never go out of the stable in winter, nor do they get cold water—the chill is always taken off before they get it to drink. A bushel-basketful of the mixture weighs about 20 pounds. In the midday, after they are watered, they get a bunch of hay. This hay is made from his grass mixture, as his mowing land is seeded down with several mixtures, and one of the mixtures is Alfalfa, which

very important to give flavor and texture to butter. To have dairy cows in good condition, and to give rich, pure cream they must have change of feed, and not feed alone, but must be kept clean. The stables are cleaned every day, and the cows are curried and brushed once each day. This gives contentment and comfort to them, and if he finds a cow that does not give him an equal return, she goes to the butcher.

FULL AS A TICK.

WHILE still the ground is open, those who have trees of any kind to set may prepare the places which are to receive them in the early spring. Dig ample holes at least two feet deep and the wider the better. Remove the worthless soil and fill in with the best that can be procured. Mark the center so that in April or earlier a few spadefuls taken out will give in this mellow, rich soil a home for the roots that will insure vigor and long life.....

NOW, too, is the best time for thinning out. Cut away unsparingly the poorest of those trees that are trespassing upon each other. This means death or deformity to one or the other or both. Better save one good specimen than retain two or more that are deformed. Cut off the branches close to the main branch and cover the wound with some material that will protect it from the elements—thick paint, tar or anything that will stay put.....

MR. RANKIN is doubtless right, as he is reported to have said in the Massachusetts Ploughman. A certain amount of glass in poultry houses is all that is necessary, and a small amount too. When the sun shines it will be warm enough. When it does not shine the glass radiates the heat rapidly and leaves the house very cold. There is too much change in the temperature unless it is well ventilated every day, and this demands care.....

THE R. N.-Y. believes in having the windows in the east and west sides rather than in the south side.....

N. HALLOCK of Queens County, Long Island, N. Y., has this to say of the Ignotum Tomato which originated with Prof. Bailey now of Cornell University:

"I am greatly pleased with the Ignotum and the more I see of it the better I like it. I have 23 plants, and have picked 10 crates and have more to come. It was the second to have ripe fruits (Station first), but at the end of 10 days the quantity was greatly ahead of the Station. The quality is A 1; solidity, ditto. It has been picked longer than almost any other variety. I have no wrinkled ones.."....

PROF. BUDD, of the Iowa Agricultural College, writes that the Idaho Pear kept perfect foliage during the past season which was the worst for leaf fungi "in our prairie history."....

ONE of the merits of the new white grape Green Mountain is it *earliness*. Another is its pure quality. It has not a trace of foxiness. Ripe grapes of this variety were sent to us last season from New Canaan, Conn., when Moore's Early were ripening at the Rural Grounds.....

ONCE create a market for Angora fleece, and the hardy little breed will carry civilization nearer to the tops of the mountains than California gold ever did is the opinion of the American Sheep-Breeder. The writer says he once owned a flock of grades in the Sierra foothills. As soon as a permanent demand has been created for their fiber they will be better property for the mountaineer than sheep. They require neither fence nor herder; they always come home at night, and when dogs or coyotes assail them they make a bee-line for the corral, the buck covering the rear and turning often to beat back the enemy. Their flesh is good mutton and their milk is free from offensive taste.....

A WRITER in Farm and Fireside proposes to put a one-foot layer of potatoes for seed into a pit dug three feet deep, cover with a foot of chaff, with a board cover on top and upon this place soil to the depth of two feet. This will be left until June, and the tubers, if all right, will be taken out and used for planting. The plan seems worthy of a trial.....

THE ROLFE APPLE.—If any one is finding a profit in growing the Gravenstein—and it is a very profitable apple when well grown—we advise him to try the Rolfe, a Maine apple, highly recommended by the Pomological Society of that State as being much like the Gravenstein, but a month later. It is a seedling of the Blue Pearmain, and keeps up to and beyond the holidays So says Dr. Hoskins in the Vermont Watchman.....

WE are pleased to learn that Mr. Wilmer Atkinson has withdrawn from the Chinook-Montana-Boom Enterprise. Such enterprises are for editors without consciences and who do not care a whiff for the welfare of the public they profess to serve.....

ABSTRACTS.

——SUNDAY SCHOOL TIMES: "Man's 'proper study'—rightly conducted—is himself, the only personality that he has always at hand, and into whose inner life he can look.

It may be thought to be part of conceit to be continually studying oneself. More commonly, however, self-discovery is a very humbling, as it is always a sobering process. The conceited man is always the man of little real self-knowledge. However much we may find to commend in ourselves by the process of self-discovery, there will always be enough that ought to be regretted, changed, and forsaken, to effectually check any excessive self-estimation to which we may be inclined."....

——FARM, STOCK & HOME: "Cattle are low in price—very low—and many of my neighbors are reducing stock as rapidly as possible; in fact, I learn that there is a general reduction going on all over the country, but I am doing the exact contrary. 'When everybody goes out I always go in' has been my lifelong motto, and I am able to pay my debts too."

——WESTERN RURAL: "How much sooner it gets too dark to saw wood than it does to play lawn tennis."

THE MIRROR *via* TRIBUNE: "One of the strongest copartnerships on the farm is Breed & Feed."

——PHILADELPHIA INQUIRER: "How inconsistent men are. When a couple of them are poisoning themselves with whisky they are sure to preface the dose with well wishes for each other's health."

"The man who is content to idly stand,
Nor strives his hopes to gain,
Will get a ticket to the promised land
And then will miss the train."

—Traveler.

——BINGHAMTON HERALD: "Yes, there is plenty of room at the top, and there always will be unless facilities for getting there are improved."

——FARM AND FIRESIDE: "It will not pay you to make a banker of your merchant. Pay him cash, even if you have to borrow the money with which to do it."

——PUCK: "A Cereal Story—Acknowledging the Corn."

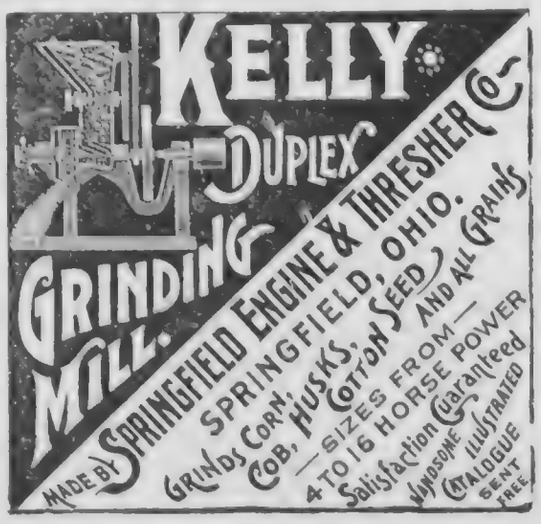
Hood's Sarsaparilla 100 Doses One Dollar

Do You Feel all tired out, nervous, irritable and without appetite? Hood's Sarsaparilla will overcome that tired feeling, tone your nervous system, purify your blood, sharpen your appetite, cure indigestion and sick headache, and make you cheerful and happy. Be sure to get Hood's Sarsaparilla.

NOTHING ON EARTH WILL **MAKE HENS LAY** LIKE SHERIDAN'S CONDITION POWDER

Highly concentrated. Dose small. In quantity costs less than one-tenth cent a day per hen. Prevents and cures all diseases. If you can't get it, we send by mail post-paid, One pack, 25c. Five $1. 2 1-4 lb. can $1.20; 6 cans $5. Express paid. Testimonials free. Send stamps or cash. Farmers' Poultry Guide (price 25c.) free with $1.00 orders or more. L. S. JOHNSON & CO., Boston, Mass.



475,000

COPIES OF THE

Double Christmas Number

OF

THE YOUTH'S COMPANION

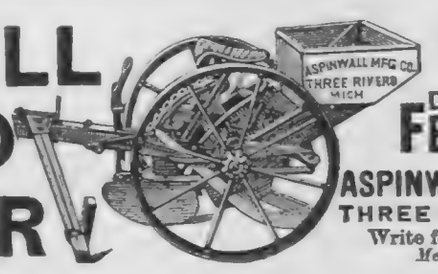
Mailed to any address for FIVE cents.

Choice Stories — Twenty Pages — Finely Illustrated.

Free to Jan. ANY NEW SUBSCRIBER who sends us $1.75 at once will receive The Companion FREE to Jan., 1890, and for a full year from that date. This offer includes the Four Double Holiday Numbers and the Illustrated Weekly Supplements. Send Check, Money Order or Registered Letter at our risk. *Please mention this paper.* Address,

THE YOUTH'S COMPANION, Boston, Mass.

ASPINWALL POTATO PLANTER



PLANTS CORN DISTRIBUTES FERTILIZERS

ASPINWALL MFG. CO.
THREE RIVERS, MICH.
Write for illustrated circular.
Mention this paper.

TOWER'S TRADE FISH BRAND MARK.

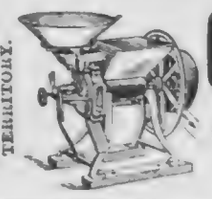
SLICKER The Best Waterproof Coat.

The FISH BRAND SLICKER is warranted waterproof, and will keep you dry in the hardest storm. The new POMMEL SLICKER is a perfect riding coat, and covers the entire saddle. Beware of imitations. None genuine without the "Fish Brand" trade-mark. Illustrated Catalogue free. A. J. Tower, Boston, Mass.

FAY'S CURRANT HEADQUARTERS GRAPES LARGEST GROWER OF GRAPE VINES IN AMERICA

NEW GRAPES, ESTHER (white), and ROCKWOOD (black), originated by E. W. BULL, originator of the CONCORD GRAPE. Also EATON, MOYER, and all others, new and old. Best and Cheapest. Small Fruits. Free Catalogues. CEO. S. JOSSELYN, Fredonia, N.Y.

Agents Wanted IN UNOCCUPIED TERRITORY.



—THIS IS THE— **QUAKER CITY GRINDING MILL** IMPROVED DURING 1889.

For Corn and Cobs, Feed and Table Meal. Grinds finer, runs lighter, is more durable than any mill on the market. Send for Catalogue before buying.

A. W. STRAUS & CO., Philada., Pa. Territory East of Ohio. | SPRINGFIELD IMPLEMENT CO., Springfield, Ohio Territory West of Pennsylvania.

ELLIOT'S PARCHMENT PAPER THE DAIRYMEN'S FRIEND

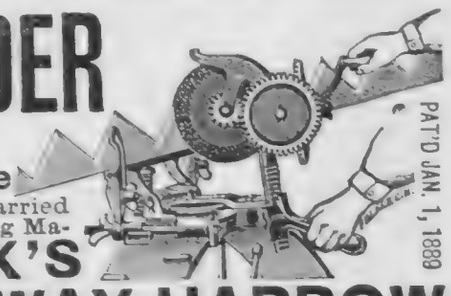
The Cheapest, The Best, The Highest Quality. Over 10,000 progressive creameries, dairymen, farmers and dealers indorse it in place of muslin or wax paper, for wrapping Butter, Cheese, Lard, Meat, Sausage, Etc., Etc. Good butter demands a good wrapper. Send for samples and testimonials to dealers in Dairy Supplies, or

A. G. ELLIOT & CO., Paper Manufacturers, Philadelphia, Pa.

OUR NEW **U. S. MOWER KNIFE GRINDER**

The Most Complete MOWING MACHINE KNIFE GRINDER made

Small, Light. Weighs only 13 pounds. Can be carried into the field, and attached to Mowing Machine Wheel.



ENTIRELY NEW.

CLARK'S CUTAWAY HARROW

SUPERSEDES the PLOW! BEATS the WORLD! Ground Made into a PERFECT SEED BED. HAS A SEEDING ATTACHMENT FOR SOWING ALL KINDS OF GRAIN. Send for New Circular, with full description, FREE.

HIGGANUM MAN'F'G CO.

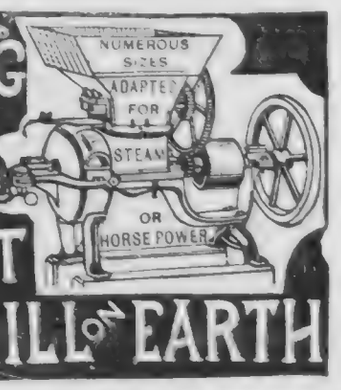
HIGGANUM, CONN.: 189 AND 191 WATER STREET, NEW YORK.

NEW STRAWBERRY "LADY RUSK"

The best berry for long distance shipments. Will not rot or melt down if packed dry. Headquarters for all leading varieties of Berry Plants and GRAPE VINES having 300 acres in cultivation. Catalogue free.

WM. STAHL, Quincy, Ill.

THE **SCIENTIFIC GRINDING MILL**



GRINDS EAR CORN with or without Shucks on and all small Grains, in fact everything which can possibly be utilized for feed.

THE BEST MILL ON EARTH

SAFETY BOTTOM and other Practical Devices to prevent breakage should iron accidentally get into Mill.

GRINDING PLATES reversible, self-sharpening, double the capacity of all others. Sold on trial. All Mills fully guaranteed. Simplest, lightest running, strongest, fastest grinding. Send for circulars.

THE FOOS MANUF'G. CO. SPRINGFIELD, O.

THE
RURAL NEW-YORKER,
(34 PARK ROW, NEW YORK),

A National Journal for Country and Suburban Homes.

Conducted by
ELBERT S. CARMAN.

SATURDAY, DECEMBER 14, 1889.

NOTICE.

THE RURAL NEW-YORKER is invariably discontinued at the end of the term subscribed for. Any copies sent to non-subscribers are sent without charge as specimens merely.

OUR readers will greatly oblige us if, when answering advertisements in the R. N.-Y., they state where the advertisements were seen. We like to have our advertising patrons know how much business we send them. It is well known that the R. N.-Y. looks after the interests of its readers, consequently those who declare themselves R. N.-Y. readers are sure to receive prompt and courteous treatment.

THE report of the National Women's Potato Contest will be published next week. Over 200 souvenirs will then be awarded. Many of the contestants wish copies of the paper sent to their friends. Send lists of names at once and the R. N.-Y. will have the papers mailed.

THE RURAL NEW-YORKER clubs with the Weekly New York World or with the Weekly Chicago Times one year for $2.25.

With the Chicago Inter-Ocean, or Detroit Free Press, one year, $2.50.

With the Century $5.50; or with Harper's one year, $5.

Club prices with any other publication will be furnished on application.

SHALL we take the last Proceedings of the American Pomological Society to guide us as to the most popular kinds of strawberries—those having the most double-stars? If so, the Wilson stands first, Charles Downing second, Sharpless third, Cumberland fourth, Miner fifth, Triomphe de Gand sixth. Kentucky receives the highest number of single-stars.

IT is well the public should be guarded in their dealings with Mr. Alfred Rose of Penn Yan, N. Y. It was he who by letters and in his circulars claimed that the R. N.-Y. No. 2 Potato was in reality a variety which he originated, refusing to recall these statements or insinuations until late in spring when, having effected all the sales possible, and under the threat of prosecution, he confessed they were different.

PROF. WM. SAUNDERS of the Central Experiment Farm of Ottawa, Canada, writes that his crosses between the blackberry and raspberry were so unpromising that he has lost all interest in them. The R. N.-Y.'s hybrids, judging by those that have fruited, are equally unpromising, but we have not lost all interest in them. It is proposed to raise seedlings from these hybrids, selecting seed from those that resemble both parents.

ONE result of the R. N.-Y.'s investigations as to the cost of farm life is shown in the following note from a Massachusetts farmer:

"I can give no estimate on family expenses for this year, as our whole trade has been done by the exchange of farm produce at the different stores. I shall be able to give an account another year, as I propose to know at the close of next year what the farm has done."

FASHIONS in farm products change. We find the latest illustration of this in the Paterson market where most of our eggs are sold. Up to this year white eggs were in highest demand. People seemed to believe that a brown shell was an indication of a stale egg—that is, the older the egg the browner the shell. This year many customers want the brown eggs and ask the privilege of picking them out. This may seem like a simple thing, but it means a good deal to some of our farmers who have kept Leghorn fowls because the market demanded a white egg. With this "color line" broken down, there is likely to be a change of breeeds not to the disadvantage of the farmer. Brahma, Wyandotte and Plymouth Rock birds will now give, to most of our farmers, better satisfaction.

FLORIDA ORANGE TRADE.

WE are told that the Florida orange crop promises to be light this year. In spite of this, sales just now are very unsatisfactory to both shippers and sellers. The market has been simply stuffed with fruit which sold at as low a figure as has probably ever been known for fruit of good appearance and condition.

The main fault seems to be in the shipping arrangements. But little account seems to be made of the quantity needed to supply the market. Shippers should study the market demands and not crowd so much fruit upon us at once. So far as it has examined into the matter, the R. N.-Y. is greatly pleased with the auction system of selling fruits which is spoken of on page 828. We see little reason why more Florida fruits should not be handled in this way.

Another complaint made by sellers here is an old one. "Growers must learn to pack and grade their fruit more carefully before much better prices will rule and before a generally better market will prevail. There is much complaint because of the great irregularity of the quality of every brand of fruit." Thus writes a dealer of long experience. What do the orange growers propose to do about it?

The R. N.-Y. is greatly interested in the Florida orange and truck business. It wants to see them both succeed. It would much prefer to see the fruit markets reserved for the products of American soil. We shall have more to say about Florida products hereafter, particular attention being given to the best arrangements for packing, shipping and selling. We shall be glad to receive the views of any of our subscribers in Florida, and will take pleasure in aiding them to the fullest extent of our ability.

FERTILIZERS FOR FRUITS.

THERE are undoubtedly many localities where stable manure is more expensive than chemical fertilizers. Perhaps the most striking illustration of the truth of this statement may be found among the Florida orange growers. Here we have a country admirably adapted to the growth of oranges, but strikingly weak in the physical requirements that go to make a successful stock-growing country. The soil is not naturally strong—how is it to be fed? It is safe to say that in many localities, stable manure is out of the question, and that chemical fertilizers must be used. And the question at once arises—what sort of fertilizer shall we use? What element is most necessary in orange culture? In this connection the R. N.-Y. wishes to call attention to the following extract from a well-known orange-grower of Florida. It seems to strike at the root of the matter.

"From a somewhat extended experience as an orange grower I am convinced that, taking the whole State together, orange-growers are applying too little potash to their groves. It is 'the one thing needful' in our sandy soils. Nitrogenous manures produce a rapid and seemingly vigorous growth, but it is at the expense of permanent vigor and vitality in the tree. Fertilizers are too often judged only by their immediate effects. The full penalty of this unequal system of fertilization does not come perhaps for years, and then the trouble is beyond remedy, and the unfortunate grove owner who mourns over his diseased and dying trees is utterly at a loss to account for the trouble."

And again, in a subsequent letter this same writer says: "I do not wish to recommend potash manures exclusively—far from it. This would simply be an error in the opposite direction—less disastrous perhaps than the other, in our conditions of soil and climate, but still an error and to be studiously avoided."

This means, if it means anything, that while a fertilizer rich in potash is necessary in the production of the orange crop, one-sided fertilizers, containing an excess of any one ingredient, particularly nitrogen or phosphoric acid, are harmful in the end.

A WORD TO OUR READERS.

THE RURAL NEW-YORKER is pre-eminently a paper for progressive farmers—for those who are ever anxious to excel in their calling by improvements in their appliances, seeds, live stock and methods. To satisfy this class of patronage, it is necessary that the paper itself should keep fully abreast of the foremost thought, the most advanced practice and the most economical methods of the times, at home and abroad, and this has been our constant aim and endeavor. The contents of the present annual volume, now near its close, afford our readers ample evidence of the results of our efforts during 1889 and a fair indication of what they may expect from us in 1890. Like all others who are eager to excel, we hope to do better in the future than we have done in the past; but our readers must judge of the former by the latter. Each has witnessed the play, read the book, eaten the cake and has, doubtless, come to a conclusion. He is ready to say: "I *do* or I *do not* want the R. N.-Y. for another year." Very naturally, we shall part with the latter class, however small, with concern, for who can help regretting that his earnest efforts to please and instruct have failed to win approbation? Very naturally, too, our feelings for the former class are quite cordial. We look upon them as friends. We wish to help them all we can; and shall also be thankful for a little help from every one.

Fresh subscribers are constantly needed not only to increase but to maintain the circulation of a paper. In addition to those who drop off because they have some real or imaginary fault to find with our work, others discontinue their subscriptions on account of death, change of occupation or location, hard times and for other causes. Not the least effective way of replacing the names of these on our list and of adding others to it, is through the kindly influence and good words of the friends who know us, our aims and our labors. In other matters as well as in religion, it is quite natural for good people to wish that others should adopt what they themselves approve, and a few words of praise in behalf of the R. N.-Y. opportunely spoken to neighbors of similar interests or congenial tastes would help us wonderfully, and also in their results benefit our readers by enabling us still further to improve the character of the paper.

In this connection it may be repeated that we will gladly send one or several specimen copies of the R. N.-Y. to any farmers whose names our friends may be kind enough to favor us with, and we shall feel much obliged for such lists. Now, just now and during the next few weeks is, *par excellence*, the opportune time.

The yearly subscription price will remain unchanged, viz., $2 for single copies; $1.50 in clubs of five or over. The R. N.-Y. clubs with all other respectable periodicals and the lowest rates will be furnished on application.

BREVITIES.

A GOOD month this to breed your cows, you folks who want to make winter butter

ON the first of January next the R. N.-Y. will commence its 40th year of existence. It was born, as Moore's Rural New-Yorker in 1850.

IN the opinion of the R. N.-Y. there is a growing sentiment among the thoughtful, conservative citizens of New York that the World's Fair is not wanted here.

THERE seems little room for doubt that caponizing roosters is growing in practice, and the market for good capons grows, too. But it's a cruel practice in spite of all.

THE Parker Earle Strawberry should be tried by our Florida subscribers. Its record in Texas, its home, gives some evidence that it will prove of great value in Florida.

THE cost of a ton of N. Y. City stable manure, delivered upon the R. N.-Y. premises (one mile from the station) is $2.65. Twenty five cents are charged for cartage.

BUTTER that is too strong and rank to be eaten on bread will do to cook with. Why? The products that give off the bad odors are volatile. The heat of the cooking drives them away.

THE R. N.-Y. feels safe in saying that the "Notes on a Back Number" special will be about the liveliest paper we have ever printed. It will serve to introduce a good many new correspondents.

THE rather strange spectacle of a cat with a bad case of sore throat has been seen at the Rural farm the past week. The cat was cured by applying the remedies generally used for human beings.

TO LEARN something about the influence of feed on butter, take all grain and hay away from the cow and feed her on straw and poor hay for a few days. Then try to make butter out of her cream.

IT is worthy of notice that for Florida the last American Pomological Report does not give a star to any variety of blackberry except the Lucretia, and to that it gives two stars. The Peen-to Peach is given one star.

THE question raised on page 820 as to the relative profit in keeping 25 hens or a cow is an interesting one. The R. N.-Y. will obtain some facts that will show how the matter stands in various parts of the country.

"TWELVE sweet, Florida oranges 25 cents." "Messina lemons, 30 for 25 cents." "Sweet, Russett Oranges, 16 for 25 cents." "Sugar Pines, 15 cents; two for a quarter." "'Grape Fruit' five cents," These are signs familiar to every New-Yorker.

AS THE year nears its close it is well that we should ask ourselves certain questions: Are we happier now than a year ago? Are our wives and children happier? Is the home dearer? What good have we done; what harm? What are we living for?

THIS is the way a Canadian friend puts it:

"I am confident that the R. N.-Y. makes much more money for me than it costs by following its kind advice, and when I pay only $2 00 for it per year I consider I am quite a lot ahead."

THE next picture of tools will be of those used by a Lucas County, Ohio, farmer, who says: "I have as good a kit of the latest improved machinery as can be found on any farm in Ohio—Mr. Terry's not excepted." We shall be able to decide that when the picture is printed.

THE New Jersey State Horticultural Society will hold its 15th annual meeting in the State House at Trenton on Wednesday and Thursday, December 18 and 19. The meetings of this society are always interesting and profitable. These Jerseymen know what to talk about and what to say. Go if you can.

ONE of our neighbors is eating his cake and keeping it too. How? He sells his new-laid eggs at four cents each, and eats last spring's eggs that have been kept in salt. These eggs are suitable for cooking. It appears that eggs from hens kept in a pen away from the roosters keep better than do fertilized eggs.

PROF. A. J. COOK'S statement concerning squirrels as rat catchers is being questioned by a good many of our readers. We learn of a good many instances where the two animals live on the same premises in comparative harmony. As Dr. Groff points out, on page 822, the squirrels are about as mischievous as the rats.

ANY of our readers who have used coal ashes as a fertilizer or as an improver of light soils will oblige us by sending their experience in the matter. The answers given on page 821 to a question relating to this matter are somewhat of a surprise to the R. N.-Y. We should have supposed that the ashes would have been best for heavy soils.

Dairy Husbandry.

FARMERS' INSTITUTES.

(RURAL SPECIAL REPORT.)

Farmers' institutes in New York for 1889—1890; *the institute at Plattsburgh a success, those at Malone and Ogdensburgh wet-blanketed by heavy rains; the chemistry of cattle foods; value of corn-fodder at various stages of growth; different feeding rations; how milk becomes tainted; valuable hints from experts.*

FORTY-FIVE farmers' institutes conducted in the same manner as those of previous years, will be held by the State Agricultural Society in this State during the coming winter. Their success in the past has established the value of these meetings beyond controversy. Crowded houses seldom fail to greet the institute workers on their second appearance in any town. Mr. J. F. Converse, of Woodville, will relieve Secretary Woodward of the general charge of the meetings this winter, though any correspondence in regard to them should be addressed to the latter at the office of the society in Albany. A new feature in a few meetings of the institutes will be the furnishing by the society of an extended report to all the local papers in the county in which an institute is held. The force of speakers has been materially strengthened by the addition of Prof. J. W. Sanborn, formerly of the Missouri Agricultural College, and of Prof. A. J. Cook of Michigan, in a few meetings.

The first institute was held at Plattsburgh November 18th and 19th. The weather was fine and every session was well attended. Though no local speakers could be secured to address the meeting, the interest increased to such an extent that a large farmers' club was organized at the close of the last session. Fortune would not smile on the farmers of Franklin and St. Lawrence Counties, for during the meetings at Malone on November 20th and 21st, and at Ogdensburgh on the 22nd and 23d, the weather was execrable. Rain fell every day and nearly all the day. Despite this, there was a fair attendance. More young men were present than at Plattsburgh. Very few ladies attended any of these meetings. Since dairying is the leading occupation in Northern New York the institutes were largely devoted to this branch of farming. We give extracts below from several dairy addresses.

THE CHEMISTRY OF CATTLE FOODS was discussed by Prof. E. F. Ladd, Chemist of the State Experiment Station. He said: "The terms nitrogen, phosphoric acid and potash were hardly known to farmers of our State a few years ago. The use of commercial fertilizers has made these terms common to all. As it is now recognized in crop growing that a rational system of plant feeding is essential, so in stock feeding a rational system is just as necessary. Different foods act differently in the animal. Some tend to produce lean flesh, some fat meat; others increase the milk yield, others affect the quality of milk. I have brought here samples illustrating the different kinds of foods and their composition.

(Prof. Ladd here displayed a fine exhibit of the chemical constituents of some important foods, the percentages of which are given below.)

	Water.	Crude Fiber.	Nitrogen-free Ex.	Albumen.	Fat.	Ash.
Corn-meal..	17.08	1.74	67.16	8.90	3.82	1.30
Wheat bran	13.71	10.83	52.26	14.56	3.11	5.53
Cotton-seed meal.....	11.06	3.56	23.86	40.56	13.57	7.39
Clover hay.	15.35	25.99	37.63	12.05	3.48	5.50
Timothy hay.....	15.35	26.83	44.33	6.59	2.69	4.16
Maize forage.....	80.66	6.10	10.07	1.54	.58	.99
Mangolds...	91.76	86	4.67	1.53	.15	1.03

Nitrogen-free extract consists of sugar, starch and gums and furnishes the heat of the animal system and body fat. Fat is used for the same purpose as the nitrogen-free extract, but is more concentrated and worth 2½ times as much. Albuminoids or nitrogenous products vary greatly in these foods, being very high in cotton-seed meal. It is used to produce caseine of milk, muscle, and, I believe, assists in the production of butter fats. Mangolds contain more water than milk. The ash in these foods goes to build up the bones of animals and contains much fertilizing matter. Thus we see that by buying the right foods we can purchase a large amount of fertilizing matter at the same time.

Corn has yielded at the Experiment Station per acre:

When tasseled, 9.02 tons, of which 8.21 tons were water.

When in full silk, 12.87 tons, of which 11.33 tons were water.

When in the watery stage, 16.30 tons, of which 13.97 tons were water.

When glazed, 16.14 tons, of which 12.52 tons were water.

When fully ripe, 14.23 tons, of which 10.27 tons were water.

The increased value of the mature corn is shown more perfectly by chemical examination. The maize in the tassel had only 189 pounds of starch per acre. When glazed it had 2,550 pounds, and when fully ripe there were 3,540 pounds of starch per acre.

In the earlier stages of this growth a cow must eat 300 pounds of forage to get 25 pounds of dry matter, a full feed. The cause of the complaint that cows did not do well this summer when grass was good was owing to the excess of water in the tissues of the plant and upon it, due to the excess of rain and lack of sunshine.

The value of fodder depends upon its physiological effect, its palatability and its chemical composition.

The physiological effect of different foods is very different.

In my experiments with feeds I have the following results:

Taking six pounds of corn-meal and two pounds of bran as our standard ration which furnishes a good butter, we find that the substitution of six pounds of gluten-meal for the corn-meal resulted in an increase in milk flow of three pounds, but a decrease in butter fat of two ounces per day.

Six pounds of linseed-meal in place of the corn-meal decreased the milk flow but increased the butter fat three ounces per day, which means an increase of 70 pounds per year.

Cotton-seed meal acted like linseed, except that it did not produce such a healthy condition in the animal.

Corn-meal gave a hard butter.

Linseed-meal made a softer butter, containing 3⅕ per cent. more olein.

Gluten-meal furnished an inferior butter.

The butter from wheat bran was white and poor.

Oats made the yellowest butter, but it was crumbly.

Buckwheat produced the poorest butter. It was white, insipid and lacked aroma. This experiment continued for two years. The first year the hay fed was Orchard Grass; the next year it was Timothy, Orchard Grass and Red Clover. A mixture of corn-meal, cotton-seed meal, and linseed-meal would be the best ration for cows. If I had silage I would feed a smaller amount of the linseed-meal than with dry hay. We fed from a mixture of 300 pounds of corn-meal, 200 pounds of cotton-seed meal, 200 pounds of linseed-meal, and 100 pounds of oats. If I were feeding roots I would lessen the linseed-meal.

When cattle foods are purchased their value as fertilizers should be made an important consideration. One ton of Timothy hay contains $5.48 worth of fertilizing matter; one ton of Red Clover hay, $8.20, one ton of corn-meal, $6.31; one ton of wheat bran, $13.10; one ton of cotton-seed meal, $28.68; one ton of linseed-meal, $21.42; one ton of oats, $8.37; one ton of milk, $2.80; one ton of butter, $0.26."

TAINTING OF MILK.—Geo. A. Smith said: "A cow feeding on grass that grows in the immediate vicinity of any putrid animal matter will give milk having the worst kind of a taint. I have a case that came to my knowledge last summer and which proves this quite conclusively. A factory in which the cheeses were well made had considerable trouble with the cheeses getting off flavor when they were about 20 days old. They started a thorough investigation and found that the trouble came from certain dairies where the pastures bordered on a small creek, and upon examination of these pastures it was found that the offal from a slaughter-house had been washed by the high water down along the banks of the creek and lodged where the cows had been feeding. It spoiled the milk, that is, the germs of putrefaction from this decaying animal matter lodged on the grass and were taken into the animal system. I am well satisfied that if the requisite means are used the milk will come to the factory very nearly as good in July and August as in September and October. The only question is—will the dairymen use the means?

Thorough äeration is one of the most essential points, the dipping of the milk for a few minutes does not do the business. It must be exposed to the air, either by using an elevated strainer, or pouring with a dipper, until the temperature of the milk is about the same as of the surrounding air during the summer months. Then we have a quality of milk in the morning whose flavor is all right and with enough ripeness so that the lactic acid will develop in about the right time, and the curd will not lie in the whey and become slippery or develop a gas as it is almost sure to do where the milk is cooled with cold water and not äerated. One of two things must happen to the factory system before long: either the careless, slovenly dairymen must reform and take better care of their milk, or those who produce good milk and take care of it will have to organize by themselves for their own protection. There are too many farmers who think if they can get the manufacturer to take their milk, no matter what the condition, that they are all right, because it all goes in together and will go to market in a lump, and if it does not sell for the top price, the manufacturer must make it up to that, as in a majority of cases he agrees to do."

Prof. Ladd.—Chemical examination of our silage has shown that corn loses for every 100 pounds put in a silo about five pounds, but the dry matter loses 13.5 per cent. Corn left in the field to dry loses 11.5 per cent.

Prof. Cook.—If I were commencing farming I would give this general-purpose-cow question much thought. The gentleman who has taken the first prize on butter in Michigan for the past three years, feeds silage. The trouble with the man who can't make good butter from silage is that he does not know how to make silage.

Mr. George A. Smith.—The best cow for cheese is the one that gives the best balanced milk. I would rather have an excess of butter fats in the milk than too little.

Milk at this time of the year is viscid, and often becomes cold before being strained, so that the cream will not rise easily. To correct this, add about a pint of water at 110 to 120 degrees to a-half pan of milk, bringing its temperature to 98 degrees. Then, when the milk is set in rooms where the temperature is about 60 degrees, the cream will rise easily and quickly. More cheese is produced from milk that is thoroughly äerated.

In answer to inquiries from the "Question Box," Secretary Woodward said: Remember that the food furnished cows can affect the quality of the butter. There are two values to these foods, a feeding value and a manurial value. If I can get cotton-seed meal for $22 per ton and realize the cost for feeding I have the fertilizer without cost. If we realize this manurial value we must take care of the manure.

I have 60 cows in my barn that do not leave the barn from November 1, till the next spring. I have practiced this for six years. My cows pay me better by this system than by being turned out. The best water for the cow is the warmest, up to 90 degrees. If you do not warm it the cow must after it enters her stomach. That costs money.

Last winter my cows were put into two barns; one lot had silage and the other roots. The cows that had silage on less grain and less clover hay gave 10 per cent. more milk and sold for $5.00 more in the spring.

Prof. Sanborn.—There is not to be found anywhere in the literature of science and agriculture a proof that anything is added to the value of food in the silo. German experimenters have shown that green food has no more value than dry food. One-fifth of the food cut into the silo is burned up in the average silo of the present time. When this loss is brought down to 10 per cent., I will be a friend of the silo. There is a gain in palatableness which makes it a

CHAT BY THE WAY.

JUST at this season fairs and bazars of every kind are being arranged, and it is often a matter of much deliberation to decide on some form of entertainment. At our fair recently the admission fee was larger than usual—we think two dollars—but every person who attended had the privilege of selecting any one article he or she chose from the wares displayed within. Some of the articles were worth more than two dollars; others less, but the choice was unrestricted. Of course such a high admission fee would not answer in many places, but a lower rate might be charged, and some prize be given with every ticket. Have pretty trifles done up in fancy paper packages, so that there would be the fun of opening them, like an ordinary prize package.

* * *

WE usually find that musical or varied entertainments take better than anything else. Quite an attractive entertainment is a café chantant. The room should be arranged like a restaurant, with as many little tables as possible and plenty of chairs; one of the greatest disadvantages to many fairs is a lack of seats, and it is terribly tiresome to stand about all an evening. The girl waiters might wear ordinary dresses, with caps and aprons, or some fancy cotton frocks, such as Swiss peasants are supposed to wear. They should be ready to serve the usual refreshments. At one end of the room a little stage should be arranged with as large an orchestra as can be managed. One can usually find a piano, violin, and flute, if no more. The orchestra should give music, from time to time, and there should be singers, elocutionists, or anything else that can be arranged. The idea is not to give a long entertainment, where people have to sit still on hard benches for three hours at a stretch, but to give the same entertainment broken up by frequent intermissions. People can move about and talk, sit at the tables and take some light refreshment, while being amused by occasional music, etc. A very ordinary entertainment becomes extremely attractive under these circumstances.

A good attraction for the café chantant is the "humanophone," a wonderful new musical instrument. Perhaps some of our readers are familiar with it. It must be hidden behind a curtain while the showman, who carries a long baton, gives a little address to the audience on the wonders of his instrument. When the curtain is drawn aside it displays a large sheet. Painted on it is a large musical staff with the ascending scale of notes, do, re, mi, fa, sol, la, si, do. Each note has its name painted under it, but the note itself is represented by a living human face. Of course, to arrange this eight young ladies stand behind the sheet, being raised on steps, each one higher than the next. They slip their faces through holes in the sheet, put just in the places of the notes. The showman or performer has, of course, thoroughly drilled them beforehand. Each girl sings simply the note she represents, the performer plays a tune by pointing his baton rapidly from one to another, each note answering to the gesture. The effect is very funny.

Spelling matches are rather old-fashioned now, but they often wind up an entertainment with a good deal of fun. Not very long since a great deal of interest was excited by the prizes in a spelling bee which finished an entertainment. Prizes were offered for the first person spelled down, and the one who lasted longest, these prizes being a hunting case stem-winder, and an open face. At the end of the match the prizes were brought out, and were slowly unwrapped by the winners. The hunting case proved to be an ordinary *pie*, with upper crust, the open face a cranberry tart without top crust. As everyone was prepared for a Waterbury, there was much amusement over this.

* * *

ONE thing we never countenance, and that is the system of lotteries and raffles at a fair or entertainment. No matter what the object is, these are illegal ways of money-getting, and must be characterized simply as gambling schemes. They bring discredit on many societies and should never be permitted.

GOLDEN GRAINS.

EYES grow dim and hands grow weary, hearts grow faint, and feet falter upon the path of life. There are few, indeed, who pass through life without being brought into some night of darkness, when what is prudent in business, or possible in the relations of life, or right in the service of God can hardly be determined, and when the soul, blind indeed, can only cry out in the darkness: "Teach me thy way, O Lord."..... .....

WHEN we begin to live out of ourselves, to appreciate interests that we do not share, and sympathize with joys and sorrows not our own, to respect knowledge that we have not gained, and wisdom from whatever source it comes, then shall we be released from the chains which keep us back from seeing much that is true, and feeling much that is good, and our lives will become full and rich to ourselves and precious to others.....

YOU find yourself refreshed by the presence of cheerful people; why not make earnest effort to confer that pleasure on others? You will find half the battle is gained if you never allow yourself to say anything gloomy.....

UNCEASING and relentless watching over ourselves, is the price of success in the higher aims of life.....

Domestic Economy

TOKENS FOR CHRISTMAS.

"Pumpkin pie! Cinnamon beer.
Christmas comes but once a year!"

"ONCE A YEAR!" Well, once a year is enough when one wants to make a lot of Christmas gifts and has a very slim purse to do it with. But a slim purse, or rather a slim allowance of "siller" may be made to go a great way after all if one only knows how.

To me a present fashioned by the fingers of one whom I love is far more acceptable than a gift which may cost twice as much, coming direct from some store. Perhaps the donor of the latter has gone off on some shopping expedition and bought for me the first thing that struck her fancy. But the giver of a token made by her own deft fingers, must have thought me worthy of having time and labor expended upon me. Hence my appreciation of the "home-made" in preference to the "boughten" gift.

Below I will give some directions as to the making of little tokens for Christmas:

TO MAKE A HANDKERCHIEF CASE.—Take a piece of chamois skin 18 inches long and nine wide. Line with some soft surah or China silk. Between the lining and the chamois skin put a thin layer of cotton, sprinkled with sachet powder. Turn one end back on itself (lining in), so as to form a pocket six inches deep. This, you see, will take up 12 inches of the length. You will then have six inches remaining. Double again, book fashion. This will give you a book-like case six by nine inches, with a pocket inside for handkerchiefs, six inches deep, (or taking up one entire side.) Bands of ribbon may be fastened across the other side, under which to slip handkerchiefs. The outside may be decorated to suit the fancy. A case made of chamois, lined with pale blue surah, and trimmed with pale-blue ribbon would be pretty. Across the back (on the outside) run a band of ribbon from the upper left-hand corner to the lower right-hand corner and finish with dainty little bows. A trailing design of wild roses and forget-me-nots painted or embroidered on the chamois, would add a beautiful finish. A case of this kind may be made from plush, velvet or satin, to suit the fancy.

* * *

A GLOVE CASE may be made in a very similar manner, only the pocket need not be so deep, and instead of bands of ribbon on the opposite side, fasten two or three tiny little pockets, made of whatever material you have, on the outside. In these put buttons, glove needle and sewing silk, also a glove buttoner. On the band of ribbon across the outside may be painted in gilt letters: "For that soft white hand of thine."

A SEWING BASKET is always a useful gift for a housewife. I saw a very pretty one the other day made as follows: "Take a square of very stiff cardboard, about seven or eight inches on each side. Cover the outside with some heavy linen or canvas and line the inside with golden China silk. The four sides were made of card-board, covered with the canvas or linen, and lined with gold silk. The sides were the same width as the bottom where they joined it, but gradually sloped out so that the top of each side was about three inches wider than the bottom. Each side was made separately and a heavy gold-colored cord was fastened around it. These cords were sewed together in joining. Little pockets for spools and thimble were sewed to the inside, opposite each other. On two of the outside pieces (on the canvas) were painted little rural scenes. On one of the remaining sides were painted, in gray and white, a spool of cotton and a pair of scissors; on the other, a needle-case and part of a paper of pins. These were very realistic indeed. The basket, of course, would be very pretty without the addition of these little artistic touches, but if one can paint, they may as well be added.

* * *

HEAD-RESTS for the back of a rocking-chair make nice gifts for mother, sister, or friend. First make two bags (either rectangular or "saddle-shaped) of cheese-cloth and fill them with cotton; also add sachet powder. Then make an outside covering for each of plush, velvet, satin, silkoline, or cretonne, as you prefer. Cover three little brass rings (which you can buy for five cents per dozen), with floss, by crocheting them over, plain stitch. Join the two bags with these rings—one at each end, and one in the center. Tie ribbon bows where you fasten to the chair. One bag or cushion rests on the back of the rocker where the head will lie and the other hangs over the back. This is a great improvement on the tidy as it is of some use. The size of the cushions will depend on the chair they are meant for. They may be made as elaborate as one pleases—embroidered or painted and composed of the most beautiful materials. But if one makes them so frail and delicate they will not be serviceable, and will not be useful either. Some dark shade of plush, such as golden brown, olive or bottle-green, tied with gold-colored ribbons would answer nicely. But if you want to make a head-rest for the old sitting-room rocker, so that father or mother may take comfort out of it, make it of some bright cretonne and tie it with serviceable, (though bright) ribbons.

* * *

RING-WORK has largely taken the place of embroidery and lace. In all the art needle-work stores in New York we see the rings put to all sorts of uses. They come in four sizes and range from three to eight cents per dozen. Pin-cushions of satin are now covered with ring-work instead of embroidery. Select the rings of the desired size—the smallest size is best for covering a cushion. Crochet them over with heavy floss; then join them with some fancy stitches. I saw a pretty cushion covered with peach pink surah with ring-work of the same color covering the whole top. The rings were arranged so as to form clusters, and between the clusters were little spider-webs made of floss. Rings, with tassels hanging from them, formed a fringe around the entire cushion.

Pretty tidies are made by having a band of ribbon, a band of rings (about four deep) another band of ribbon; then another of rings, etc., till the desired size is attained. Rings, with tassels falling from them, form fringe for top and bottom.

* * *

ONE OF THE LATEST CRAZES IN TABLE DECORATION is a set of grape leaves, six in number, to be arranged around the centerpiece. If you have any relations or friends who give little dinner parties a set of these leaves would make a nice gift. At the retail stores they cost $8 a set. If you buy the materials and make them yourself they will cost you just about $1.25. The leaves are stamped on heavy white linen. They are about eight inches long. With silk floss (get what they call "electric" floss) embroider an uneven jagged button-hole stitch around the entire leaf. Then do the veining with Kensington stitch. When finished, cut the leaf out. If you have a large dining-table and have some handsome center-piece of fruits or flowers, lay these leaves, stems in, around it. The effect is lovely in the extreme. Each leaf may be embroidered in a different-colored floss, thus adding a rich, warm glow to the table.

* * *

A PRETTY SHAVING CASE for brother may be made by taking a rectangular piece of card-board seven inches wide and nine inches long, cover with chamois skin and line the back with silesia. From the upper left-hand to the lower right-hand corner stretch a piece of ribbon about an inch wide. Finish each end with a bow. On the upper side of the case above the ribbon band, and to the right, paint a spray of witch hazel, or a branch of the fir tree, with cones. Below the band, to the left paint two or three large acorns. On the ribbon paint, in quaint-looking letters: "Take a shave?" Fasten a ribbon across the top to hang up by. Finish with a bow. A case covered with chamois, with an old rose band across and tied with gold and old-rose ribbons and painted as described above would be pretty. So also would one made with pale-blue and gold ribbons, painted with daisies and buttercups. To the back of this are attached sheets of tissue paper to be used for shaving purposes. A pretty case may be made in like manner by taking a piece of Whatman's drawing paper with jagged edges to be used for the front. The papers come in rectangular pieces seven by nine for seven cents a piece. One made of this material and trimmed with old gold and olive ribbons, with one or two sun-flowers painted on the front, would be very dainty and effective

* * *

APRONS ALWAYS MAKE USEFUL PRESENTS. If for a busy housekeeper make them of some good substantial material, long enough to protect the dress. A dainty little apron made of soft sheer mull with a four-inch hem, hem-stitched to the apron, then a row of feather-edge above that, then another row of hem-stitching and tied with ribbons at the waist, would be a nice present for sister, or aunt, or friend. Another pretty apron is made by taking one breadth of dotted mull of the desired length. Turn a four-inch hem and feather-edge it to the apron. Then with golden wash floss embroider a row of daisies across the entire apron above the hem. Use the dots of the mull for the centers and make the petals of long, loop stitches. Tie the waist with blue and gold ribbons.

* * *

IF YOU HAVE A GRANDMOTHER LIVING, don't give her some little trifling thing; but make her some good substantial gift. A nice flannel wrapper would be just the thing. A gray or a black-and-gray-mixed flannel would be best. Make it after the Mother Hubbard fashion, and have a belt to fasten in front. Make the sleeves roomy so as to be comfortable. Another useful thing for the old folks would be an afghan to be thrown over one while taking a nap, or to be thrown across the foot of the bed at nights. (See RURAL of November 23, page 779, for directions for making).

* * *

A NOVEL WAY OF DISTRIBUTING CHRISTMAS PRESENTS is to set the dining-table as for the ordinary meal—only of course one should have on the finest cloth. Then put a soup dish at each one's place. All the presents may be put in these soup dishes, or if they are too large they can be arranged in front of them. When all is in readiness have the dinner bell sounded and let the family assemble as usual. There will be lots of fun and merriment midst the opening of the packages. Try it!

DORA HARVEY VROOMAN.

ON CHARITY'S SIDE.

ISN'T it about time to let Charity alone? If her cares and trials are such as to sour her temper a little and make her portray the faults of her brother so that the mirror held up to nature comes too near home for readers, there is no reason for

When Baby was sick, we gave her Castoria,
When she was a Child, she cried for Castoria.
When she became Miss, she clung to Castoria,
When she had Children, she gave them Castoria

calling hard names. I happen to know that she is a *bona fide* girl: that she says these very things and Bert lives and breathes to-day as reckless, as warm-hearted, as careless of his sister as ever in the way of work-saving. He lets her wait on him, hunt up his cap when he throws it under the table, pick up after him continually, and I do not wonder at girls on lonely farms sometimes comparing their lot with that of those who have every facility for taking life easier. In fact, I can point my pen to 50 girls like Charity in their aspirations for better things, that will not be put down by sneers, or helped by jeers. They are girls who do their duty and work on in their little sphere trying to "make things pleasant in one little place," and many of them you would never suspect of deeper feelings; but they feel all the same the necessity for something else, and inwardly rebel against the dreary routine. Especially is this felt when city people come who have so much easier, broader lives—no pig-killing, sausage-making or lard rendering, etc.; no bread-making, dairy work, calf-feeding or poultry tending, to say nothing of the improved appliances which they do have for regular housework.

"Oh!" said a "Charity" to me the other day, "if we only had a kitchen like Mrs. Townhouse's—hot water and cold, no pumping and heating in pots, stationary tubs and a washer-woman. It seems like entering a housewife's paradise to go into her kitchen." Oh, do not blame such girls, and when the brothers make things harder by their carelessness and want of thought, what better outlet than the RURAL NEW-YORKER for telling their troubles, even if one of them sometimes forgets that "charity covers a multitude of sins."

The RURAL NEW-YORKER is not kept up specially for successes. Its editors bid us tell of our failures, of our reverses, and our trials, and if but one "Bert" should see himself "as ithers see" him, the space will not be lost that has been given to the letters that have brought forward such comments. No one can tell another's trials without living the other's life, and the picture presented by Charity is one not overdrawn. In fact I am of the opinion that its very truthfulness causes all the trouble. Charity is not a perfect girl by any means; but her outspoken protests would not tell against her if I were judging character.

Why, she said to me lately: "I had no idea they would put such severe and absurd constructions on what I wrote," and I replied: "Well, little girl, you will find out if you write for the newspapers that the public is Janus-faced, and can take anything you may say just as it happens to suit them." All this my wife indorses.

JOHN REAL.

COMFORTABLE HOUSE-KEEPING.

ALL good housekeepers have a system, a programme for each day of the week, a special day for this and for that kind of work, and the more thoroughly systematic the housekeeper the more thoroughly disconcerted is she when the "mill does not turn round with a free goodwill," with the exact grist for its particular day.

When a woman finds her world all going wrong from any one well known cause, interruptions that have kept and will keep right on occurring all through life, she should ask herself if she is simply existing to wash on a set day, that she may iron, bake, sweep and wash again, just as the Western farmer, according to a humorist, "lives to raise corn, to feed hogs, to sell for money, to buy land, to raise more corn, to feed more hogs, to sell for more money," etc., till the Omnipotent steps in and puts a stop to the business.

There is always a sensible and a comfortable medium between all extremes, and it exists between too much "system" and no "system," and it can be found by every progressive woman. The most contented housekeepers that I know, are those that have no "special days;" who plan for not more than two days ahead, doing each day whatever is the most necessary. Necessity first, then convenience. Preparing meals, washing dishes, making beds, and keeping living-rooms in order are necessities that belong to every day of the week, and should never be interfered with by any other housework.

To devote the whole time between breakfast and dinner to any one kind of work means to a woman of average strength, the eating of a dinner in anything but a comfortable state of body and mind. It is well known that if we change our work the labor will be less tiresome than continuous work of one kind; but some women are so constituted, they are such slaves to "habit," that in preference to dividing work—washing for instance—between two mornings, they would rather prolong the agony even till afternoon, and spend the remaining day in restoring their strained muscles and nerves to their normal condition. It is an easy matter to divide a washing between two days in winter or summer, and thus take advantage of both warm and short forenoons, and lessen the labor at the same time.

It is better to combine one-half of a washing with as much sweeping as can be comfortably done before the dinner hour than to devote the whole time either to washing or sweeping. A divided wash can be finished in connection with bread-baking, and the clothes can be out drying earlier than otherwise possible. Cake or pie-making or both can be followed by as much plain ironing as time will admit, while the sweeping of one or more cool rooms will give a needed change from the starched clothes for an hour or more.

I know the objections that many women have to dividing work in this way, and yet the same amount of labor is accomplished and with a degree of comfort not found in any system that does not make allowance for rainy wash-days and unexpected company. Ought a well-kept house to need sweeping from cellar to garret upon any one day of the week? Do prudent housekeepers allow a dearth of bread, pie and cake to occur at one time? Nothing short of sickness or poverty should compel one to do a washing under unfavorable circumstances.

It is no wonder that so many girls dislike house ork, when they see old housekeepers sit down during the valuable hours of a forenoon to pare pumpkins for stewing, and pass the afternoon in making pies; to prepare fruit for cooking, and be canning or making jelly or jam till the going down of the sun; wading through wet grass for fruit or vegetables; hanging clothes out and bringing them in, thawing them out and drying them by the fire; never washing one window without washing twenty; never cleaning one room without cleaning the whole house through, and never cooking a *mouthful* for themselves, but *all* for the "men folks."

Personal appearance has more to do with making housework pleasant and in creating a dislike for it in young women of naturally refined and sensitive natures, than the real work itself. To any who may doubt this assertion I would say: "Please comb your hair and dress yourself throughout the same as you would if expecting company to dinner, and protected by a good, big apron, go into your kitchen and do your work carefully, daintily (an accomplishment), and then note your feelings and see if you have not discovered something—something that will add to your own contentment, and may add to the happiness of some other woman not as large yet or as old as yourself."

VERY OFTEN

Life has been saved by a bottle of

AYER'S Cherry Pectoral

The best emergency medicine, it should be within reach of every one, young and old.

"Several years ago, on a passage home from California, by water I contracted so severe a cold that for some days I was confined to my state-room, and a physician on board considered my life in danger. Happening to have a bottle of Ayer's Cherry Pectoral, I used it freely, and my lungs were soon restored to a sound and healthy condition. Since then I have invariably used and recommended this preparation, and always with beneficial results."—J. B. Chandler, Junction, Va.

Prepared by Dr. J. C. Ayer & Co., Lowell, Mass. Price $1. Six bottles, $5. Worth $5 a bottle.

News of the Week.

HOME NEWS.

SATURDAY, December 7, 1889.

THE first session of the 51st Congress began at Washington last Monday. In accordance with the decision of the caucus of Republican members held a few days previously, Mr. Reed, of Maine, was elected Speaker, next to the President the most influential official in the country. He'll have a mighty hard job for the next fortnight fixing about 58 committees so as to give a Republican preponderance in each and satisfy everybody.....The President's message approved of subsidies for American steamships under the guise of "liberally remunerative" appropriations for ocean mail service. It urged national aid for the education of the colored people of the South and the supervision of the election of Congressmen by the Federal authorities. It says the tariff should be revised but distinctly insists that "protection" and not "revenue" should be mainly considered. It suggests that the tobacco tax might be repealed, and the whisky tax modified. It takes both sides on the silver question. It recommends the transfer of the Weather Bureau to the Department of Agriculture and indorses the recommendations of Secretary Rusk.....After a long illness Jefferson Davis, President of the late Confederacy, died at a friend's house in New Orleans, at 12:45 Thursday night, December 5, aged 81.....
Senators Reagan, Sherman and George have already introduced three anti-Trust bills into Congress.....The President's message strongly favors improved car-couplings for the benefit of brakemen; but contains not a word about the deadly car stove. .....Senator Edmunds favors the establishment of a grand national university at Washington in celebration of the 400th anniversary of the discovery of America instead of a World's Fair anywhere.....
A gigantic bank, with a capital of $25,000,000 of English and American money, to be operated under the English "Liability Act," with headquarters in London and branches in Philadelphia, New York, and Chicago, is about to be established. There will be smaller branches in the chief financial centers of continental Europe.....
C. Edward Silcott, Cashier of the Sergeant-at-Arms of the House of Representatives at Washington, D. C., has just absconded, taking with him $72,000, which he had drawn from the U. S. Treasury to pay Congressmen, besides $10,000 belonging to the Sergeant-at-Arms Leedom, the Democratic official of the last House, who has not yet surrendered the office to the new Republican Sergeant, Holmes of Iowa. The fugitive also took $11,000 belonging to Congressmen for back pay which hadn't been drawn, making, in all, $93,000. He was under bonds for $50,000 and his bondsmen are good. It is thought that investigation may show that the loss is as high as $142,000. The rascal took with him a notorious woman and left a wife, children and grandchildren without a cent. He is supposed to have found congenial refuge among the dishonest American colony in Canada. Of course, it now comes out that the business of the Sergeant-at Arms' Office was carried on in a very slip-shod fashion.....
Governor Mellette of South Dakota has found 650 families in Miner County in urgent need of help to carry them through the winter. Donations may be sent to him. .....Baltimore is getting a large share of the shipment of grain to Europe, while Philadelphia elevators are almost empty. Last Wednesday nine steamships were chartered for the business in the Monument City, and the Quaker City groans.... .....The old Monongahela House at Pittsburgh has just been cremated: no lives lost. .....At the close of the war there were 6,000 colored children in the schools of Georgia, now there are 150,000.....
As regards the World's Fair, New York has already raised $5,175,000 as a guarantee fund and is slowly going ahead to make it $10,000,000. She asks no financial aid from Congress, but intends to incorporate a company with a capital of $20,000,000 in $10 shares. In spite of the loud talk of most of the papers, there is very little, if any, enthusiasm about the matter. Chicago has a guarantee fund of $10,000,000, but New Yorkers say that hardly a third of it is genuine. The Windy City, however, is exerting herself vigorously all over the country to secure influence in favor of her selection as the site, and has lately begun to operate in Europe. St. Louis has a guarantee fund about equal to Chicago's and probably with the same amount of inflation, and is steadily working in her own behalf. Washington is "lying low" in hopes that the rivalry of the others will give her the big show. A considerable majority of the Congressmen who have given an opinion on the matter favor Chicago; but more than half of them declined to express their views.....
On December 3, the annual convention of the Farmers' Alliance of the South, also known as the Farmers' and Laborers' Union, began at St. Louis. Over 300 delegates were present. At the same time delegates to a convention of the Northern Alliance met at the Planter's House. They numbered 75 and represented the State organizations of Illinois, Ohio, Minnesota, Wisconsin, Iowa, Kansas, Nebraska, the Dakotas, Colorado and Washington. Delegates were present in the city also from the Farmers' Mutual Benefit Association, the Agricultural Wheel and the Knights of Labor. Telegraphic reports of the proceedings have been extremely meager, in view of the importance of so large an assemblage of representatives of Agriculture and Labor. According to the latest reports the Northern and Southern Farmers' Alliances, the Farmers' Mutual Benefit Association and the Agricultural Wheel have consolidated, and the Knights and the new organization are now in consultation with a view to co-operation rather than confederation.....A factory at Newtown near this city has for a long time been turning out cart-loads of sausages every day, and it has only just been discovered that they have all been made of horse flesh. The proprietor is defiant as there is no law against such an industry.....
The law against the publication of Sunday papers is strictly enforced in Canada, but the profane public greedily buy up papers published in the United States on the Sabbath, and now the Canadian publishers are crying out for protection.....A large part of the 10,000 population of Key West, Fla., has for years consisted of Cuban cigar-makers. They have nearly all gone home: out of 179 cigar factories only one remains open.....A New Jersey farmer bequeated to Henry George $30,000 to be spent in disseminating his ideas. The heirs contested the will on the ground that such an object was against public policy. The courts have decided to the contrary and the money will be expended for printing a large edition of "Progress and Poverty" to be distributed among farmers for what it will bring.....The manufacturers of barbed wire fences have at last formed a "combine" to put up prices under the name of the Federal Steel Trust. The present rates of duty on barbed wire and its materials range from 70 to 100 per cent., so what's to prevent an extortionate monopoly?.....
In his message President Harrison suggests that the Sandwich Islands should be requested to send a representative to the Pan-American Congress. It is thought that this is an indication that Secretary Blaine wants to add that convenient half-way station between America and Australasia to this country. There's much trouble there now about Chinese immigration. The chief industry of the islands is sugar production, and this is made profitable almost entirely by Chinese cheap labor. There are 19,217 Mongolians now on the islands, or 20 per cent. of the population. They have 23 per cent. of the licenses for wholesale merchandising; 62 per cent. of the retail merchandising; 84 per cent. of the victualing licenses; 91 per cent. of the pork butchers' licenses; 57 per cent. of wholesale spirit licenses, and a large proportion of other licensed occupations. There are about 600 Chinese mechanics to 700 of other nationalities .....
Kansas City has just added 22 square miles of prairie to her corporate limits.....
The people of Iowa voted to put Prohibition into the State Constitution, but their intention was defeated by legislative bungling. Now that the majority have changed their minds and elected a legislature opposed to Prohibition, Local Option and High License are likely to be embodied in the laws.....An official statement reduces the losses by that big Lynn fire from $10,000,000 to $1,009,500! Some of the shoe manufacturers will go South; several intend to settle in Norfolk, Va.....
The Kaweah Co-operative Colony in the San Joaquin Valley, California, from which such great things were expected by enthusiasts who believed in the theories enunciated by Bellamy in "Looking Backward," after flourishing for three years in the foot-hills, 35 miles from Visalia, appears to be going the way of all such enterprises. Those who have invested money in it—and folks in all parts of the country have done so to a greater or less extent—are likely to meet the fate of the investors in that Topolobampo Colony in Sinaloa, Mexico.....Many of the school-houses of Dakota have been provided with barrels of water, potatoes, beans, coffee and cooking utensils in case of a blizzard siege.....
Per count just completed the amount of Uncle Sam's cash in the Sub-Treasury in New York City is $183,253,206.08 in gold, silver, etc.....

FOREIGN NEWS.

SATURDAY, December 7, 1889.

AFTER three years of unparalleled hardships, of heroic endurance, marvelous resources and indomitable pluck, the greatest traveler and explorer that ever lived, the peer of the most undaunted heroes of all the ages, Henry M. Stanley, reached the coast at Bogamoyo, near Zanzibar, last Wednesday with Emin Pasha and the other rescued whites. His geographical discoveries are wonderful and valuable. Very justly, all nations, from the sovereign to the peasant, join in honoring the hero and the chivalrous Emin also. After escaping death in multitudinous forms in Central Africa, the latter has probably met it just after his arrival at Bagamoyo. Being very near-sighted, he walked out of a window by mistake and fell 20 feet upon the pavement. His body was terribly bruised and his head seriously injured. At last reports he was dying.....
A project for building a monstrous bridge, over 20 miles long, across the English Channel, connecting France and England, is taking substantial shape. The project of building a connecting tunnel was vetoed by the English government as likely to make an invasion possible. Wouldn't a bridge be equally hazardous?.....There's an epidemic of influenza at St. Petersburg. The Czar and the imperial family have been afflicted just as badly as 50,000 others. .....A famine is threatened in eight southern districts of India owing to a total failure of crops.....Strikes were hardly ever so numerous in England and several monstrous ones are threatened. In nearly all cases the men get all or most of their demands. In South London 1,780 men at the gas works threaten to go out on December 13, and the gas work men at Manchester, as required by law, have given notice that they will also strike.....The United States of Brazil appear to be getting along admirably. There has been no fighting, and foreign countries seem well disposed towards the new Republic. In the southern part of the country about 200,000 Germans have settled to escape the grinding militarism and taxation of the Fatherland, and Bismarck seems desirous that they should start a little government of their own under German protection, but nothing serious is likely to come of the matter.....
The Tory Government in England is to introduce into Parliament a bill making an appropriation of from $35,000,000 to $50,000,000, for the purpose of buying out the landlords in Ireland, and selling the land, on the installment plan, to the tenants. This is only the first Tory demand for the purpose. Under the Ashbourne Act passed in 1881, $25,000,000 were appropriated by the Liberal Ministry for the purpose; but this has been all expended.....While all the rulers of Europe are talking peace assiduously, they are all industriously increasing their fighting strength, busily building new fortifications and strengthening old ones, and spending vast sums on improved cannons, rifles and gun-powder. The dock-yards of all the naval powers are alive day and night. Larger armies, more powerful fleets and bigger appropriations are constantly demanded in the name of ——peace.....

"The Fiberite M'f'g Corp. of Skowhegan, Maine, have acquired the sole right to manufacture the Symmes Hay and Grain Caps, and although they are making every effort to be in a position to fill orders for the coming season, it will be wise for the farmer to send in his order early in order to secure them in time. Send for circular.—*Adv.*

AGRICULTURAL NEWS.

SATURDAY, December 7, 1889.

IT is said that no stallion is allowed to stand for service in Italy unless his soundness has been certified by a commission appointed for each province in the kingdom. .....Robert Bonner keeps adding to his stock of trotters. He recently visited the Palo Alto farm, and Sunol his latest acquisition, was brought out for her new owner to see. After warming up, she was speeded for a single quarter which she made in 31¼ seconds, a 2:05 gait. Mr. Bonner was delighted with the mare, and says that she will make a mile in 2:05 another year. The eight-year-old stallion Ansel was brought out for Mr. Bonner to look at, and he was so pleased with his gait that he bought him on the spot for $10,000. He will be sent East and used for stock purposes.....Prior to 1889, there were 347 horses having a record better than 2:20; the list has been increased to 423 the past season.....
The Ohio State Horticultural Society will hold its 23d annual meeting at Columbus, December 11–13. A feature of the meeting will be the large number of discussions on live horticultural topics. Liberal premiums are offered members, a large number of papers from successful horticulturists are promised, and a general good time is anticipated. W. W. Farnsworth, secretary, Waterville.....It requires from 100,000 to 150,000 horses annually to supply the standing army in this country, and $200,000 are appropriated to pay for them .....
A shipment of 250,000 bushels of wheat was recently made from New Orleans to Uruguay, the first of the kind on record... .....The Granite State Dairymen's Association will hold its annual meeting in connection with the State Board of Agriculture, at Plymouth, January 9th and 10th. Speakers of national reputation will address the meeting. J. L. Gerrish, secretary, Mast Yard, N. H.....The ninth regular meeting of the American Horticultural Society will convene at Austin, Texas, February 17, next. Any person is eligible to membership who feels an interest in promoting the cause of American horticulture. Full particulars from the secretary, W. H. Ragan, Greencastle, Ind.....

Crops & Markets.

SATURDAY, December 7, 1889.

THE R. N.-Y. believes that the successful and profitable marketing of a crop is of as much importance to the grower as the production of the same. With this idea in mind, it is constantly on the lookout for new ideas in regard to improvements in the methods of handling and marketing farm products. Any improvement in this direction that will tend to increased prices or diminished risks and losses in handling, is worthy of the support of every friend of agriculture. We have from time to time noticed in this column the comparatively recent innovation of selling fruits at auction. Although the system has been in vogue for some 20 years in some of the larger English cities it is only within three or four years that it has been adopted here.

CALIFORNIA fruit-growers at first scouted the idea; now the two large associations that practically control all the shipments from that State say that the fruit must be sold at auction. Foreign fruits are now sold almost entirely by this method. The past autumn New York State grapes and New Jersey sweet potatoes, and more recently, Florida oranges have been thus disposed of, in nearly all cases at satisfactory

LEE AND SHEPARD'S CALENDAR FOR 1890

HURRAH FOR THE NEW YEAR

Printed in delicate tints on ivory cardboards with ribbon bows and silver chain and rings. Neatly boxed. Price, 75 cents.

IN designing this new calendar for 1890, the artist has availed herself of her original idea of little people that give so much character to the different seasons. Thus a bevy of little folks in voluminous hats and feathers, with puckered mouths, welcome 1890 with "Hurrah for the New Year," an exquisite design. For the months there are odd figures in delicate tints. January, showing in a "brief" costume, asks: "How Soon do You Think it will Thaw?" of a wonder-eyed bird. February, in Cupid array, is gathering hearts, and entreating the birds to "Come be My Love." March, with a tattered and torn umbrella and breezy drapery, is holding on for dear life, "My, What a Blow!" April has a Japanese costume and a comical phiz as he sits underneath his parasol, entreating you to "Come in out of the Rain," May is "squeezing" a spring song from the birds. June is plucking roses. July is chasing with Chinese lanterns a butterfly. August is "sweltering" in a flaxen wig and a general plumpness of figure, and gives you an invitation under her parasol. September is entreating the birds, who say: "We think of going South soon.' Little October interviews an owl to ask: "Have you seen the moon?" and the figure is as comical as the owl. November is enjoying "Thanksgiving Day in the Morning" in a delightful manner, and the charming little Miss December is anxiously inquiring "Which is the way to Santa Claus Land."

Sold by all Booksellers, or sent by mail, postpaid, on receipt of price. To any party mentioning this paper, we will send **Free** our very handsome Catalogue.

E. L. GOODSELL,

103 Park Place, New York,

Auctioneer of Florida Oranges & All Domestic Fruits,

And Agent for the Golden Gate Fruit Association of Sacramento, Cal., and Chautauqua Lake Grape Growers' Association, Brocton, N. Y.

Having a special sales room for Florida Oranges, located in the heart of the fruit trade, and devoting my whole time to the care of the same, it is for every shipper's interest that they consign all their fruit to me. All Oranges sold the day after arrival, and check for net proceeds mailed the following day. Advances made when desired. Every shipper receives a full report of the state of the market by mail, semi-weekly.

For Stencils and Further Information, address as Above.

prices. The same system of selling is followed in many other large cities.

THE METHOD may vary in other places, but here when the fruit arrives, samples of each lot are taken to the auction room and opened for exhibition. Catalogues giving number of packages and marks of each lot are furnished to buyers who examine the fruit and decide what they will pay. At the hour of sale, the auctioneer offers the choice of a certain number of packages, usually 20 to 40, from a certain number of lots, then the remainder in like manner until all are sold. The sale of a car-load usually occupies about a half-hour.

THIS system has many advantages over the method of selling through commission merchants. The volume of business has grown so large that the latter have difficulty in handling it satisfactorily, and a more rapid method is imperative, especially for perishable products or those which deteriorate rapidly. The entire shipment is disposed of immediately upon arrival, and there are no remnants left over to entail loss upon the shipper. The shipper receives immediate returns. The auction system brings the buyers together to compete with each other, thus always insuring the highest market price, as they must bid up to secure the goods. By the old system, the sellers compete with each other to effect sales, thus tending to depreciate prices. At the auction sales, it very commonly happens that as the sale progresses, competition becomes more brisk, and higher prices are obtained. The auction system, in short, is more in keeping with modern business methods.

IN common with all deviations from long-established methods, there are many difficulties to be overcome, but, from the facility with which the business is handled in the auction room, and the results thus far obtained, the main difficulties to be overcome are at the producers' end of the line. To insure success, growers and shippers must co-operate and support this system and no other. The grading and packing of all products must be improved and made uniform. Shipping of products must be so arranged that the supply is uniform and regular so far as possible. Now, the market is glutted with Florida oranges, and prices are very unsatisfactory. No method of selling can remedy this, though the auction system will secure better results than any other. If the orange growers were all organized, and would forward oranges to about equal the demand, better results would be secured.

THE pioneer of the auction system in this city is Mr. E. L. Goodsell of 103 Park Place who has a building fitted up with every convenience especially for auction sales. He has handled immense quantities of fruits the past season, and is very enthusiastic as to the future of his pet method of handling all perishable produce. As he very truthfully says: "Results always 'talk' to the grower and shipper as arguments cannot." We append some extracts from fruit-growers and shippers, to show what they think of it. The Earl Company of Sacramento, one of the two companies previously mentioned, in addition to several other favorable things, say: "We have found this method of disposing of California fruits very satisfactory, and are certainly encouraged to continue selling in this way. The auction system has many advantages over the private-sale system, chief among which, is the fact that the auction concentrates the buyers in one room where they are compelled to compete with each other; whereas the private sale system scatters the buyers and gives them an opportunity to force the sellers to compete against each other, in selling. The great benefit, therefore, in the auction system lies in the stronger competition brought about among the buyers in the auction room."

R. B. BLOWERS, another California shipper, in writing of the sale of a car-load of Emperor Grapes, says: "Considering that the Emperors had received nearly six inches of rain, and had been transferred from the original car en route, I consider the result more than satisfactory, and a very successful wind-up of the splendid sales of the past season." Charles K. Landis, the founder of Vineland, N. J., says: "The auction is the only way to fairly market produce." E. H. Fay, manager of the Chautauqua Grape Growers Shipping Association, while very cautious about passing judgment from a single season's experience, said that of over 100 cars of grapes shipped, one sold here at aution brought the most money. From the fact that they continued shipping we would infer that they believed in the method. The writer met a dealer at one of the auction sales of Concord Grapes, and afterward asked him if he bought any grapes. "No," he said; "I could buy the same fruit cheaper at any commission house." Comment is unnecessary.

THE best grades of butter have advanced quite materially, and there is a good demand for everything of good quality. Eggs are 30 cents for strictly fresh, but this does not mean eggs which have been held for several weeks. Such will bring about 22 to 25 cents. There is a good demand for the best grades of fresh fruits with consequent increase in prices. Fancy apples are scarce, and Kings sell as high as $4 to $4.50 per barrel. Western apples are better quality and bring better prices than Eastern. While Western Greenings, Baldwins, and Spies bring $2.25 to $3, Eastern and State, same varieties, are $1.50 to $2.25. Grapes are higher. Florida oranges are very plenty. The market is overstocked, and prices are low: $1.50 to $2.50 per box. Cranberries have advanced, fancy Cape Cods, $10.50 per barrel.

THE poultry market has recovered from its Thanksgiving prostration quicker than usual. Fancy turkeys have not been plentiful at any time and are in demand now at 16 to 17 cents for dry-packed. Chickens and fowls have advanced. Dry-packed are preferred, and bring better prices. Poultry should be thoroughly cooled before packing, and packed with plenty of bright, dry wheat or rye straw. Many use too little straw.

THERE have been lighter arrivals of potatoes, and prices have advanced. Scotch potatoes are arriving. Florida cucumbers are offered at $1.50 to $2.50 per crate; egg plant at $3 to $6 per barrel; and string beans at $1.50 to $1.75 per crate. Southern vegetables sell well when of good quality.

A $25 WATCH FOR ONLY $5.50
Solid 18k. Rolled Gold Plate.
To introduce our **Solid GOLD and Solid SILVER Watches** we make this **Special Offer.** There is so much cheap trash offered in these days in the line of watches, by irresponsible advertisers, that the public hardly know what to expect; yet, a good watch at a low price is what they are looking for, and that is what we offer in the watch illustrated here. This watch is entirely new; the cases are of the beautiful shell pattern that has heretofore been found only in most expensive solid gold watches. Being made from **Solid 18k. Rolled Gold Plate,** we guarantee them to stand the strongest acid test. It is full Jeweled, Lever Movement, Fine Nickel Works, and fully warranted by us to be an **accurate time-keeper** in every particular. We warrant each watch for five years. In carrying this beautiful watch you will have the credit of owning a $100 Solid Gold Watch, and for use it is just as desirable. We send this beautiful watch by Registered Mail, post-paid, for **only $5.50** If you want to see the watch before paying for it, send us 50 cents as a guarantee of good faith, and we will send the watch by express C. O. D., with privilege of examination at Express Office, and if you do not find the watch just as represented, you need not take it. Can we make you any fairer offer? To every person sending the cash with order, $5.50, we will send a beautiful **Gold Plated Chain Free.** We can supply Ladies' or Gentlemen's size watch. We send our new 1890 Catalogue free. Any Bank, Newspaper or Commercial Agency will tell you we are a reliable house.

BLANCHARD'S ILLUSTRATED JOURNAL,
5 & 7 Warren Street, New York.

Literary.

MAGAZINE REVIEWS.

ST. NICHOLAS presents an interesting variety for boys and girls, old and young, in its Christmas issue. "The Boyhood of Thackeray" is an entertaining and instructive account of the boyhood days of England's great novelist, by his daughter Anne Thackeray Ritchie. The article is illustrated by fac-similes of drawings and letters hitherto unpublished and by an engraving from a bust of Thackeray at 11, and another from the last photograph taken of him. "Buffalo Hunting" is a very exciting account of adventures in the Far West by Theodore Roosevelt. These animals are now nearly extinct. "Intercollegiate Foot-ball in America" by Walter Camp, gives some reminiscences of several contests between noted college teams. Tudor Jenks contributes a very moving tale about the "Professor and the Patagonian Giant," from New York, in which the Professor furnishes a supper for the giant, who was a cannibal, and who said there was a flavor of originality which he liked about the man. "Daisy's Calendar" tells how Daisy, a young lady who was "never quite well," and whose life contained many shadows, kept a calendar for a year. Each evening, if the day had been a happy one, she drew a red line all around the date; if the day brought only some gleams of gladness she made a red dot for each gleam, and if it was a day of sorrow unrelieved by any brightness, the date was left surrounded by its own black line. It is a capital idea. Prof. Boyesen contributes a story from the Norse legends, "Little Alvilda." "May Bartlett's Step-Mother" a serial by Nora Perry, is begun in this number. There are several excellent things in verse: "How the Emperor Goes" by M. Helen Lovett; "An Autumn Revel" by Ida W. Van der Voort; "If the Babes Were the Bards," by Francis Randall; "For Christmas Day," by H. Butterworth, and "The Story of the Iceberg" by Harriet Prescott Spofford, all with characteristic illustrations. Alice Maud Ewell gives an incident connected with the Indian massacre in the early history of Virginia; it is very quaintly told in the language of the time. The Century Co., New York.

THE Thanksgiving number of The Youth's Companion is worthy of special mention. The first cover page is a triumph of the engraver's art. The articles are appropriate to the day, and the illustrations are numerous and excellent. The matter is not of the goody-goody sort which nauseates the readers of some so-called youth's papers, neither is it of the sensational, blood-and-thunder style which is a curse to our country, but it is made up of stories having such a resemblance to the experiences of wide-awake, vigorous boys and girls, that they cannot fail to be read with a sympathetic interest. The tone is elevating and good. If you have not seen this paper, you have missed a great deal, and should send for a specimen copy to The Youth's Companion, Boston.

THE LADIES' HOME JOURNAL never seems satisfied with its acknowledged excellence and high standing, but is constantly adding new attractions. Beginning with the New Year, the Rev. Dr. Talmage will edit a regular department with the title: "Under my Study Lamp." It is given out that Dr. Talmage's salary is one of the largest ever paid for editorial work, but the figures are not given. Send for a free sample copy of this excellent paper to the Curtis Publishing Co., Philadelphia.

THE NEW YORK LEDGER

"THE WHOLESOME EDUCATOR OF MILLIONS."

FREE TO NEW SUBSCRIBERS

If you are not convenient to a news stand, send two dollars to the address below and the Ledger will be sent to you FREE till the first of January, 1890, and then continued for a whole year from that date.

THE LEADING WRITERS.

CELEBRATED ARTISTS.

$2 A YEAR SIXTEEN PAGES EVERY WEEK

SPECIAL FEATURES.

Herbert Ward, Stanley's Companion.

Herbert Ward, the companion of Stanley in his explorations in Africa, is the only white man connected with Stanley's African explorations who has ever returned alive from the "Dark Continent." Mr. Ward's articles running through eight numbers of the "Ledger" are of the most intensely interesting description, and cover five years of his adventures in Africa, and they will be illustrated by sketches made by Mr. Ward, and by the reproduction of photographs taken by him in Africa. These pictures will throw much light upon the manners and customs of the hitherto unknown cannibal tribes of Africa.

The Story of a Forsaken Inn, (A SERIAL STORY) *By Anna Katharine Green.*

Life in British America, *By Rev. E. R. Young.*

Being the adventures and experiences of Rev. E. R. Young, the celebrated missionary, and his wife during their residence in the Polar region twelve hundred miles north of St. Paul, in which Dr. Young narrates how he tamed and taught the native wild Indians of the Northwest; how he equipped himself for and how he made his perilous sledging and hazardous canoe trips when visiting all the Indian settlements within five hundred miles of his home.

Honorable Henry W. Grady

Contributes a series of six articles on the "Wonderful Development of the Industrial Pursuits of the New South."

American Cookery, (A SERIES OF ARTICLES) *By Miss Parloa.*

Giving the reasons why it is imperfect, and some ways by which it may be improved.

Nihilism in Russia, *By Leo Hartmann, Nihilist.*

Leo Hartmann, a fugitive from Russian authorities, has been connected with the most daring feats of the Russian Nihilists. Mr. Hartmann shows how the intelligent people of Russia are becoming Nihilists in consequence of the despotism of the form of government. A participant in plots to kill the Czar, such as the blowing up of the Winter Palace, he is able to give true information as to how this and other great schemes were accomplished. The situation in Russia is sufficient to increase the love of every true American for our form of government.

EXTRA SOUVENIR SUPPLEMENTS.

Among these beautifully illustrated four-page souvenirs, which will be sent free to every subscriber, will be a poem by

John Greenleaf Whittier, *Illustrated by Howard Pyle.*

Written for the "Ledger" by Mr. Whittier in his 82nd year. Another souvenir will be a beautifully illustrated poem written by

Honorable James Russell Lowell.

The Ledger will contain the best Serial and Short Stories, Historical and Biographical Sketches, Travels, Wit and Humor, and everything interesting to the Household.

CATARRH HAY FEVER CATARRHAL DEAFNESS

A NEW TREATMENT.

Sufferers are not generally aware that these diseases are contagious, or that they are due to the presence of living parasites in the lining membrane of the nose and eustachian tubes. Microscopic research, however, has proved this to be a fact, and the result of this discovery is that a simple remedy has been discovered which permanently cures the most aggravated cases of these distressing diseases by a few simple applications made (*two weeks apart*) by the patient at home. A pamphlet explaining this new treatment is sent *free* by A. H. DIXON & SON, 337 and 339 West King Street, Toronto, Canada.

Law.

"Every Man is presumed to know the Law. Nine-tenths of all Litigation arises from Ignorance of Law."

COLLECTING A JUDGMENT ON A MORTGAGED FARM.

"An Old Subscriber," Monroe County, N. Y.—A, a neighboring farmer, owes me a considerable amount of money, on which he failed to pay interest, as per agreement, and I couldn't get him to pay the principal either. I sued him and a short time ago obtained judgment. His farm, however, is already encumbered with mortgages and judgments procured prior to mine, to an amount nearly equal to its full value. Can I, on my judgment, sell A's remaining interest in the property, and in case it is struck off to me, when can I come into possession? If I can't get any money out of the property, I would at any rate like to get A dispossessed. Can I do so?

ANS.—If the judgment obtained by our inquirer was not rendered by a justice of the peace for less than $25, it may be docketed in the office of the County Clerk, when it will become a lien upon the real estate of the defendant. An execution may be obtained, and after the sale has been advertised for six consecutive weeks, the property may be sold. The purchaser will take it subject to all prior liens. He may then, by summary proceedings, obtain possession in about two weeks. He must first give A 10 days' notice to quit. If he fails to leave, a precept will be issued returnable in not less than three or more than five days, when A will be required immediately to show cause why he should not be deprived of his possession. On his failure to do so, he will be ejected. Unless our inquirer becomes the purchaser of the property, or gets a friend to buy it for him, we know of no means by which he can dispossess A.

WHEN LEGACIES ARE PAYABLE IN NEW YORK.

L. M. T., Livingston, N. Y.—Should an executor pay legacies one year after probate of a will or one year after the death of the testator? In the case in which I am interested the will was contested and letters were not issued to the executors until the will was sustained many months after the testator's death.

ANS.—The law in this State provides that "no legacies shall be paid by any executor or administrator until after the expiration of one year from the time of granting letters testamentary or of administration, unless the same are directed by the will to be sooner paid." The general rule is that legacies draw interest from the time they are payable. If, however, the legacy is given by a parent to a child and no provision is made for its maintenance other than the income from the legacy; or if it is a life-estate to a child, or to a widow in lieu of dower, the interest is payable from the day of death. When an annuity is bequeathed generally; that is, where a sum of money is bequeathed to be put out at interest and the income to be paid over, the legatee is entitled to interest from death, provided a sufficient amount remains after paying debts and other legacies. Unless the case in which our inquirer is interested comes under one of these conditions, the legacy cannot be paid until the expiration of a year from the issue of testamentary letters, however long this may have been delayed; and interest can be drawn only from that time.

CATALOGUES, ETC., RECEIVED.

CLARK'S CUTAWAY HARROW.—Circulars from the Higganum Manufacturing Corporation, New York. The R. N.-Y. has this implement in use and does not hesitate to praise it. Strictly speaking, it is more of a plow than a harrow. We have found it very useful in cutting up sod ground and working in manure.

INVALID ROLLING-CHAIRS.—Catalogue from H. S. Golightly, 203 Quarry Street, Philadelphia, Pa. The catalogue is filled with pictures of invalid chairs which seem to be very comfortable and easy to wheel. We feel sorry to think such chairs are ever needed, still let us get the best we can when they must be bought.

PURINTON'S FARM BOILER.—Circulars from J. K. Purinton & Co., Des Moines, Iowa. Our readers will remember the series of letters on "Cooking Feed" which were printed in the R. N.-Y. some six weeks ago. The parties contributing to that "symposium" used the Purinton boiler. They stated all that needs to be said about it here. We may add, however, that it is frequently used in laundries and bath-rooms for heating water for washing and bathing purposes. Send for the circulars.

POULTRY SUPPLIES.—Price list from C. H. Dempwolf & Co., York, Pa. These supplies comprise bone meal, granulated bone, crushed oyster shells, ground shells, calcite, crushed flint and ground beef-scraps. The goods are all first-class, and poultry people who need such supplies may feel satisfied that they will get what they order from this firm.

WATCH CATALOGUE.—Pamphlet from H. R. Hardenbrook, 58 Liberty Street, New York. This pamphlet gives illustrations and descriptions of over 1,000 watches, which are offered at very reasonable rates.

AGRICULTURAL SUPPLIES.—Circulars from H. B. Griffings' Sons & Co., 70 Cortland Street, New York. At this old-established house will be found tools of all sorts at fair prices.

"MYSELF."—This is the title of a beautiful 26-page book issued by James Vick, Rochester, N. Y. It is a poem describing the life of a little country girl who loves Nature and grows up to young-womanhood in an entirely natural manner. The book abounds with pictures which are printed in colors. It is intended as a souvenir to be given to subscribers to Vick's Monthly Magazine for 1890.

D. LANDRETH & SONS, PHILADELPHIA, PA.—A large-sized, illustrated catalogue of specialties in vegetable garden seeds for 1890. This firm is headquarters for the Garfield and State of Maine Potatoes, both excellent varieties. The above firm is the oldest and one of the most trustworthy in the country.

KNABE PIANOS.—Circulars from William Knabe & Company, Baltimore, Md. It appears that Dr. Hans Von Bulow, the celebrated pianist is using the Knabe pianos on his present concert tour in this country. He finds them superior to other makers'. A great many more humble musicians than Dr. Von Bulow have come to the same conclusion.

THE COOLEY CREAMER.—Catalogue from the Vermont Farm Machine Company, Bellows Falls, Vermont. Anybody who knows what improved dairying is can tell about the merits of the Cooley system. It is merely necessary for us to direct attention to the headquarters for the Cooley implements and to state that all classes of dairy goods are also to be obtained there.

SUN AND SHADE.—From the Photo-Gravure Company 3d Avenue, and 10th Street Brooklyn, N. Y. This monthly publication improves with age. Each number seems more artistic than the one before it. We know of nothing in the way of art work that excels this publication.

HENCH & DROMGOLD'S

All Steel Frame Spring-tooth Harrow

A WONDERFUL IMPROVEMENT.

TEETH QUICKLY ADJUSTED BY ONLY LOOSENING ONE NUT.

The best Tooth Holder ever invented.

The tooth is held in position by a Ratchet with which it can be adjusted so as to wear from 15 to 18 inches off the point of the tooth, which is four or five times as much wear or service as can be obtained from any other Spring-tooth Harrow in existence.

Agents wanted. Catalogues free.
HENCH & DROMGOLD, York, Pa.

THE MAPES COMPLETE MANURES.

—PREPARED SPECIALLY FOR—

Potatoes, Early Truck, Corn, Orchards and Vineyards (also for Improvement of Quality of Fruit), Grain Crops, Grass Top-Dressing, Small Fruits, Tobacco, Orange and Truck Growing in Florida, Pineapples and other Tropical Fruits, Etc.

These Fertilizers are True Manures, Not Stimulants.

The official State Agricultural Station Reports show the Mapes Manures to be

THE HIGHEST GRADE MADE AND THE CHEAPEST TO THE FARMER.

They Contain the Largest Quantity of Soluble Plant Food as Compared with Cost.

PROF. GEORGE H. COOK, of the New Jersey Experiment Station, reports, in a late bulletin, what the R. N.-Y. has so persistently endeavored to impress upon its readers.

As a rule, he says, the fertilizer which contains the greatest amounts of nitrogen, phosphoric acid and potash is the cheapest; for the cost of manufacture, freightage and rate of commission are the same for high-grade as for low-grade fertilizers, and *the labor on the part of the farmer is increased as the grade of the goods decreases.*

The R. N.-Y. confidently anticipates the time when there will be no demand whatever for low-grade fertilizers.—*Rural New-Yorker, Aug. 24th,* 1889.

Farms Growing Steadily Richer, and Profits Increasing from the Long-Continued Use of the Mapes Manures.
NO EXHAUSTION IN ANY CASE.

"Jersey Farms That Pay."

THE RURAL NEW-YORKER, June 22d, 1889, states: "And while on this subject the R. N.-Y. is led to refer to a farming community it has just visited. This community is in New Jersey, within 50 miles of New York. The cheap lands of the West will so flood Eastern markets with staple products that New Jersey farmers will have to become gardeners or truckers! Farming cannot be done without the use of stable manure as a basis; chemical fertilizers will 'burn up' the soil! At certain seasons of the year we hear these statements repeated over and over again. How ridiculous they appear after a visit to the community we speak of. Here we have a class of farmers growing rich at producing hay, potatoes, corn and wheat. Yes, actually growing rich at producing Western products within 50 miles of New York. And it is done practically *without stable manure; a farm having less than* 10 *head of cattle sells from* $1,000 to $1,200 *worth of hay and absolutely grows stronger and more productive each year.* Under such a system of agriculture the boys stay at home, farm life is robbed of its worst features and becomes a very ideal life of comfort and happiness. We saw this life realized—saw the crops, the tools, the men. We were so interested in it that we propose to tell R. N.-Y. readers just what we saw. We hope our report will lead to some hard thinking. It will be nothing but a report as honestly written as possible."

The reports on these farms may be found in the RURAL NEW-YORKER, on pages 441 and 442, July 6th, and on pages 459 and 460, July 13th, 1889, under heading "New Jersey Farms that Pay." On these farms (D. C. Lewis's and others) the Mapes Manures have been used almost exclusively from ten to fifteen years successively, and the crops *average fully* double those grown in former years under the systems then practiced. Poor lands are now purchased at current low rates with confidence by farmers who know from experience that they can bring up these lands into good, profitable grass-growing condition, and make money from the start.

Vegetable Growing----Early Truck.

FROM THE RENOWNED NEW JERSEY TRUCK-GROWER, THEO. F. BAKER.

BRIDGETON, N. J., October 16th, 1889.

Mr. Charles V. Mapes:

It is with pleasure I report on the use and application of the Mapes Vegetable Manure. During the season just passed, I used it in comparison with other good fertilizers, but more especially against one brand having an analysis of six per cent. ammonia, 10 per cent. phosphoric acid, and five per cent. potash. Also used it in combination with stable manure, and alone. Applied from 500 pounds to 2,000 pounds per acre, as to the requirements of the crop to be grown, on the following crops: beets, radishes, early cabbage, early tomatoes, peppers, celery and late potatoes. While we have had a continued wet season, and all forms of manures and fertilizers have had a most favorable opportunity to do their best, the Vegetable Manure **stands at the head,** and showed by its marked effects upon all crops treated to an application to be the **most profitable, producing earlier and more abundant yields, most thrifty and less diseased plants.** Especially so with early tomatoes, peppers, early cabbage and potatoes.

Yours truly,

(Signed) THEO. F. BAKER, Bridgeton, N. J.

OVER THIRTY PRIZES WITH THE MAPES VEGETABLE MANURE—1889.

CHESHIRE, CONN., November 12th, 1889.

Mr. Charles V. Mapes,

DEAR SIR: Wishing to try your Vegetable Manure the past season, I used it on some 80 different varieties of vegetables. Where it was used there was a more luxuriant growth of tops and vines than in the neighboring rows and beds where we used barnyard manure.

The yields when the crops were gathered were plainly greater and of better types from the portions where your fertilizers were used than from the remainder of the pieces.

We succeeded in taking first prizes at our State Fair on sweet corn (which the committee classed as extra fine), crookneck squashes, Guernsey parsnips, carrots, onions, potatoes and beans, while at our local fair we were awarded some 30 prizes on our various exhibits.

In experimenting we could only grow a small quantity of each kind, therefore we think our success the greater. I am

Respectfully yours,

(Signed) CHARLES E. LORD.

FROM THE FLORIDA TIMES-UNION, JULY 26, 1889.

Upon the use of fertilizers, to a great extent, will depend the future agricultural greatness of this State. It is getting to be a pleasure to take a tour through our markets and see the advance we have made during the past three or four years. Where we formerly had poor, scrubby, sickly-looking vegetables and fruits, we now have a show that will compare favorably with any of the largest northern cities. Luscious and finely-flavored berries, melons and fruits; choice vegetables of all kinds, many of them comparatively unknown until within the past two or three years. We northerners have sighed for Lima beans and nutmeg melons, heretofore unattainable to us. This year we have both in all their glory, as fine as any raised anywhere. For the great improvement in these lines we must give the credit to the Mapes Fertilizers. They are far more extensively used by vegetable-growers than any other brand, and have given the most remarkable results during the past two years. They are sold all over the State, and to appreciate this fact you have only to ask the question: "What fertilizer do you use to produce this result?" and nine times out of ten the reply will be: "Why, Mapes, of course."

ORANGE TREES.

Extract from the Descriptive Catalogue of the famous Buckeye Nurseries, South Lake Weir, Marion County, Florida, GILLETT BROS., proprietors.—1889:

"We have tried about everything sold in the State in the way of commercial fertilizers, and some time ago came to the conclusion that the Mapes Orange Tree Fertilizer stands at the head of the list. For permanent effect on soil, and wood and fruit development it stands without a rival. In their pamphlet they use no ambiguous language; they agree to give us pure animal bone instead of Charleston phosphate rock, and there is no doubt but what they do it.

Send postal for descriptive pamphlets, (farm crops, trucks, grapes, fruits, etc.) The Mapes Fertilizers, owing to their high concentration are particularly well adapted for long shipment, and make a saving of fully one-half in freight as compared with ordinary Commercial Super-Phosphates.

Field Crops.

THE R. N.-Y. WOMEN'S NATIONAL

Potato Contest.

THE PRIZE-TAKERS.

Wyoming, first; Illinois, second; Minnesota, third; Ohio, fourth; Missouri, fifth; Connecticut, sixth; Michigan, seventh; Canada, eighth; Minnesota, ninth, etc.

OVER 1,000 ENTRIES.

200 Souvenirs Awarded.

The Mapes Formula and Peruvian Guano Co., New York, $100 in cash for the largest yield grown with the Mapes Potato Manure, stable manure, or both.

Awarded to Mrs. Eliza Day, Johnson County, Wyoming. Yield at the rate of 1,015⅜ bushels per acre on one-twentieth of an acre.

Rural New-Yorker First Prize $50 cash.

Awarded to Mary Rusk, Madison County, Illinois. Yield at the rate of 970.66 bushels per acre on one-fortieth of an acre.

Bowker Fertilizer Co., Boston, Mass. One ton Stockbridge Potato Fertilizer.

Awarded to Mrs. M. J. Covell, Erie County, Ohio. Yield 920 bushels to the acre on one-twentieth of an acre. This prize was won by Emma Hissam, but on account of freight charges it was forwarded to Ohio instead of Minnesota.

Lawson Valentine, President of the Christian Union Co., N. Y.—The following books (first prize) selected from the catalogue of Houghton Mifflin & Co.:

Walden by Thoreau.
Excursions in Field and Forest, by Thoreau.
Summer, by Thoreau.
Winter, by Thoreau.
Fresh Fields, by Burroughs
Locusts and Wild Honey, by Burroughs.
Winter Sunshine, by Burroughs.
Wake-Robin, by Burroughs.
Signs and Seasons, by Burroughs.
A Treasury of Thought, by Maturin M. Ballou.
Talks Afield about Plants and the Science of Plants, by Prof. Bailey.
The Philosophy of Eating, by Bellows.
Pictures of Country Life, by Alice Cary.
The Building of a Brain, by Dr. Clarke.
Rural Hours, by Susan Fennimore Cooper.
Hints on Household Tastes, by Perkins.
Castilian Days, by Hay.
The Autocrat of the Breakfast Table by Holmes.
One Hundred Days in Europe, by Holmes.
The Common Sense of Money, by Howe.
Smoking and Drinking, by Parton.
The Gates Ajar, by Elizabeth Stuart Phelps.
Beyond the Gates, by Elizabeth Stuart Phelps.
The Gates Between, by Elizabeth Stuart Phelps.
Popular Flowers, by Rand.
My Summer in a Garden, by Warner.

Awarded to Emma Hissam, Steele County, Minnesota. Yield at the rate of 935 bushels per acre on one-twentieth of an acre. It was a question upon which the judges were divided whether Miss Hissam is not entitled to second prize, her acreage being one-twentieth of an acre.

Lawson Valentine (second prize). The Waverly set of Sir Walter Scott's novels, comprising 25 volumes.

Awarded to Mrs. Agnes C. Cameron, Texas County, Missouri. Yield 854⅜ bushels on one-fortieth of an acre. Having performed all the work herself, she receives another prize as noted below.

C. L. Ingersoll, President of the Colorado State Agricultural College, $25, in 10 volumes of the works of Washington Irving, neatly bound.

Awarded to Mary E. Warren, Fairfield County, Connecticut. Yield 810 bushels to the acre, the area being one-fortieth.

Prof. J. L. Budd, Iowa State College, Ames, 50 trees of valuable new apples, pears, cherries, plums, apricots and ornamental trees and shrubs suited to the climate of the prize-taker.

MRS. AGNES C. CAMERON.

WINNER OF FIFTH PRIZE. FIG. 299. PAGE 836.

First prize.—Awarded to Mrs. Mary A. Presly. St. Clair County, Michigan. Yield 766 bushels per acre.

Second prize (PROF. BUDD).—Awarded to Mrs. Daniel Dunn, Algoma, Canada. Yield 719⅛ bushels per acre, the area being one-fortieth.

Prof. J. L. Budd, as above; third prize.

Awarded to Sarah A. Smith, St. Louis County, Minnesota. Yield 700 bushels, the area being one-fortieth.

Thorburn & Co., (New York), $25 worth of seeds (flower or vegetable) from their catalogue for 1890.

Awarded to Mrs. J. W. Baker, Bureau County, Illinois. Yield 695 2-5 bushels, the area being one-thirty-eighth of an acre.

Peter Henderson & Co., (New York), $25 collection of plants or a $25 collection of seeds, to be selected from their 1890 catalogue.

Awarded to Mrs. Etta M. Kline, Whatcom County, Washington. Yield 694 bushels per acre on one-thirty-eighth of an acre.

Rural New-Yorker $30 in cash.

Awarded to Mrs. B. F. Closson, Highland Creek, Ontario, Canada. Yield at the rate of 686 bushels per acre on one-fortieth of an acre.

H. M. Engle & Son, Marietta, Pa., $20 as follows: five Paragon Chestnut trees, five "Good" peach trees, 50 peach trees, assorted leading varieties.

Awarded to Mrs. F. A. Bly, Butler County, Nebraska. Yield 657 bushels per acre on one-fortieth of an acre.

Frank Siddall (Philadelphia, Pa.), one box of Frank Siddall's Soap, freight paid.

To Mrs. N. W. Pratt, Macoupin County, Illinois, 591⅛ bushels.

Gen. Wm. G. Le Duc, Hastings, Minn., $5 in cash.

To Flora Brown, Carroll County, Missouri, 588⅜ bushels.

Gen. N. M. Curtis, Ogdensburgh, N. Y., $5 in cash.

To Mrs. Rose T. Bigham, Livingston County, Illinois, 576 bushels.

W. A. Stiles, editor of Garden and Forest, New York, $5 in cash.

To Jane Reed, Rush County, Indiana, 574 bushels.

Sec'y. J. S. Woodward, Lockport, N. Y., $5 in cash.

To Mrs. Nancy Peck, Sonoma County, California, 570 bushels.

W. B. Alwood, vice-director of the Virginia Experiment Station, $5 in cash.

Mrs. D. A. Roorda, Marion County, Iowa, 567⅛ bushels.

George B. Loring, M. D., Washington, D. C., $5 in cash.

To Kate McFadden, Josephine County, Oregon, 564 bushels.

Charles J. Wright, Fergus Falls, Minn., $5 in cash.

To Mrs. O. Brown, Berrien County, Michigan, 560 bushels.

Prof. C. V. Riley, U. S. Entomologist, $5 in cash.

To Mrs. Aurilla Bartlett, Erie County, New York, 555 11-15 bushels per acre on one-thirty-second acre.

Mrs. E. E. Stine, Cuyahoga Falls, O., $5 as an extra souvenir to the lady who raises the largest crop by her own personal cultivation, hoeing and all necessary work.

Awarded to Mrs. Agnes C. Cameron, Texas County, Missouri. See Fifth prize.

Dr. W. J. Beal, Michigan Agricultural College, $5 in his two volumes entitled The Grasses of North America.

To Mrs. W. L. Waite, Coffee County, Tennessee, 554 bushels.

R. & J. Farquhar & Co., Boston, Mass. $5 worth of seeds (including the newest varieties of sweet-peas, asters, stocks, dianthus, etc.) to be selected from their 1890 catalogue.

To Mrs. D. T. Boyles, Cowley County, Kansas, 551⅛ bushels.

Joen S. Pearce & Co., London, Ont., $5 in seeds selected from their catalogue.

To Mary W. Hannah, Thurston County, Washington, 546⅜ bushels.

W. Atlee Burpee (Philadelphia, Pa.), $25 worth of vegetable and flower seeds, selected from their 1890 catalogue, in five premiums of $5.00 each.

First prize awarded to Adelia J. N. Peet, Marshall County, Iowa, 544 bushels.

Second prize awarded to Mary E. Haynes Licking County, Ohio, 541⅛ bushels.

Third prize awarded to Sarah E. Chamberlain, Orleans County, N. Y., 540 bushels.

Fourth prize awarded to Mrs. L. Kelley, Berrien County, Mich., 540 bushels.

Fifth prize awarded to Mrs. Elizabeth A. Fassett, Addison County, Vt., 535⅛ bushels.

Wilson Bros., Easton, Pa., $5 in a bone and shell mill.

To Phillipia Brumlay, Putnam County, Ohio, 534 bushels.

Mrs. James H. Lampman, Coxsackie, N. Y., $5 in a choice between a pair of Rouen and Imperial Pekin ducks.

To Julia S. Frogner, Grant County, Minnesota, 532 bushels.

R. N. Lewis, Red Hook, N. Y., $5 in a trio of Laced Wyandottes.

To Mrs. E. S. Lincoln, La Crosse County, Wisconsin, 530 bushels.

Theodore Neff, Bellaire, Ohio, $5 in strawberry or raspberry plants or grape vines, as may be selected.

To Mrs. C. M. Latshaw, Vernon County, Wisconsin, 529⅛ bushels.

O. P. Putnam, Leominster, Massachusetts, $5 in one pair of thoroughbred Barred Plymouth Rock chicks.

To Mrs. C. E. Dingman, Jasper County, Iowa, 520 bushels. Area 1-20 acre.

H. L. Barricklow, Rising Sun, Indiana, $5 in grape vines and ornamental shrubs.

To Mrs. A. N. Wisner, Berrien County, Michigan, 522 bushels.

Mrs. F. H. Valentine, Cranford, N. J., $5 in one pair of pure-bred Silver Wyandotte chicks, or three settings of eggs of the same breed.

To Mrs. Margaret Sneddon, Lancaster County, Nebraska, 516 bushels.

A. P. Allen, Meadville, Pennsylvania, $3 in one Single-combed White Leghorn cockerel, delivered at express office.

To Mrs. A. Miller, Frankford, Ontario, Canada, 513 bushels.

S. H. Parvin's Sons, Cincinnati, O., Six of Moody's Taylor System of Dressmaking. Price of each, $5.

First prize to Mary Weaver, Rock County, Nebraska, 509⅛ bushels.

Second prize to Mrs. O. V. Rollins, Wabasha County, Minnesota, 507⅛ bushels.

Third prize to Josephine Beasley, Skagit County, Washington, 506⅝ bushels.

Fourth prize to Mrs. Rebecca Wright, Kosciusko County, Indiana, 500⅝ bushels.

First prize awarded to Jennie S. Austin, Shawnee County, Kan., one-sixteenth acre., 484 bushels.

Second prize awarded to Myrtle Wright, Kosciusko County, Ind., 478 bushels.

Third prize awarded to Mrs. C. M. DeSel, Kaufman County, Texas, 480 bushels.

William B. Reed, Chambersburg, Pa., $20 in 10 collections of one dozen roses each for 10 souvenirs to as many ladies.

First prize awarded to Mrs. Isaac F. Crosby, McLeod County, Minn., 478 bushels.

Second prize awarded to Isa Thurwachter, Monroe County, Ill., 470 bushels.

Third prize Mrs. A. J. Jones, Sauk County, Wis., 461¼ bushels.

Fourth prize awarded to Mrs. B. C. Dunlap, Walworth County, Wis., 460 bushels.

Fifth prize awarded to Phœbe Martin, Gilliane County, Oregon, 459⅛ bushels.

Sixth prize awarded to Jessie Rupert, Douglas County, Kansas, 454 bushels.

Seventh prize awarded to Hannah A. Morton, Wright County, Iowa, 453⅛ bushels.

Eighth prize awarded to Mrs. E. T. Hammond, Winona County, Minn., 449 3-20 bushels.

Ninth prize awarded to Mrs. Wilbur C. Jennings, Fairfield County, Conn., 448 bushels.

Tenth prize awarded to Kate L. Durkee, Fluvanna County, Va., 448⅜ bushels.

MISS MARY RUSK.

WINNER OF SECOND PRIZE. FIG. 300.

Fifth prize to Mrs. W. B. Rogers, Bourbon County, Kentucky, 520⅜ bushels. This would have been awarded an earlier prize had it been received in time.

Sixth prize to Mrs. J. W. Johnson, Clark County, Kentucky, 496 bushels.

Woodason Bellows Works (Philadelphia, Pa.), $30 in powder and spraying bellows, viz: two patent double-cone bellows, extra size; two patent double-cone bellows, regular size; three single-cone bellows, large size; three single-cone bellows, regular size; two spraying bellows, regular size; in five prizes.

First Prize awarded to Mrs. C. E. Shippee, Warren County, Pa., 493⅛ bushels.

Second prize awarded to Mrs. C. M. Grossman, La Grange County, Ind., 492 bushels.

Third prize awarded to Martha Buxton, Vermilion County, Ill., 491⅛ bushels.

Fourth prize awarded to Mrs. Orson Grover, Hillsdale County, Michigan, 488 bushels.

Fifth prize awarded to Elizabeth A. Taylor, Dane County, Wis., Area one-thirty-third acre, 487 3-10 bushels.

T. H. Hoskins, M. D., Newport, Vt., $10 in iron-clad apple trees (his selection) in three premiums.

John H. Evans, Lewiston, Idaho, $12 in Idaho pear trees, one to each of six successful competitors.

First prize awarded to Mary J. Cory, Hillsdale County, Mich., 446⅜ bushels.

Second prize awarded to Mrs. Emma Bacon, Lake County, Ill., 444 bushels.

Third prize awarded to Mrs. C. J. Majory, Ocean County, N. J., 440 bushels.

Fourth prize awarded to Mrs. Eliza Spear, Ingham County, Mich., 440 bushels.

Fifth prize awarded to Mrs. J. Van Wie, Salem, Kenosha County, Wis., 440 bushels.

Sixth prize awarded to Mrs. P. B. Roberts, De Kalb County, Ind., 440 bushels.

Bratnerd & Armstrong Co. (Philadelphia, Pa.), six boxes Assorted Colors Embroidery Silk, put up one ounce in a box.

Awarded to Fannie Dick, Washington County, Minn., 437⅛ bushels.

Bartlett & Dow, (Lowell, Mass.), one Common-Sense Milk Pail.

Awarded to Mrs. L. Fisher, Johnson County, Kan., 436 bushels.

G. W. Fry, Dunlap, Mo., a choice of a setting of eggs of either Silver Wyandottes or R. C. B. Leghorns.

Awarded to Mrs. Thos. Stone, Greene County, Mo., 434⅜ bushels.

The White Mountain Freezer Co., Nashua, N. H., one four-quart White Mountain Freezer.

Awarded to Mrs. A. J. Gale, Waukesha County, Wisconsin, 434⅜ bushels.

Giddings & Read, Rutland Vt., $65, as follows: Ten prizes of 20 bulbs each of Woodbury's choice gladioli.

First prize awarded to Mrs. John H. Jackson, Erie County, N. Y., 434 bushels.

Second prize awarded to Mrs. W. H. Glosser, Warren County, Ohio, 428⅜ bushels.

Third prize awarded to Mrs. W. W. Hunt, Cuyahoga County, Ohio, 425⅛ bushels.

Fourth prize awarded to Martha A. S. Webster, Orleans County, N. Y., one-twentieth acre, 422 bushels.

Fifth prize awarded to Mrs. Kate A. Myers, Pawnee County, Kansas, 420 bushels.

Sixth prize awarded to Mrs. Jas. B. Nye, La Crosse County, Wisconsin, 420⅜ bushels.

Seventh prize awarded to Mrs. Annie V. Marsac, Emmet County, Michigan, 420 bushels.

Eighth prize awarded to Mrs. J. H. Warn, Lucas County, Ohio, 416 2-3 bushels.

Ninth prize awarded to Lucy E. Harbison, Waseo County, Oregon, 416 2-3 bushels.

Tenth prize awarded to Mrs. A. F. Morse, Audrian County, Missouri, 415 1-3 bushels.

Ten prizes of one peck each of Rogers's Seedling Potato.

First prize awarded to Annie V. Hugus, Ohio County, West Virginia, 414 5-6 bushels.

Second prize awarded to Mary C. Ingram, Chester County, Pennsylvania, 413 2-5 bushels.

Third prize awarded to Marguerith Huber, Rock Island County, Illinois, 411 9-20 bushels.

Fourth prize awarded to Augusta A. Palfreyman, Middlesex County, Massachusetts, 410 bushels.

Fifth prize awarded to Grace Sanders, Kendall County, Illinois, 410 bushels.

Sixth prize awarded to Mrs. G. M. Earl, Passaic County, New Jersey, 406⅜ bushels.

Seventh prize awarded to Mrs. Lewis B. Wheeler, Worcester County, Massachusetts, 406⅜ bushels.

Eighth prize awarded to Mary Hutton, Madison County, Indiana, 406⅜ bushels.

Ninth prize awarded to Mrs. Ada A. Haskins, Boone County, Illinois, 406⅜ bushels.

Tenth prize awarded to Mintie Grissom, Daviess County, Kentucky, 406 bushels.

Ten prizes of one pound each of the new potato, Vermont Wonder, not yet offered for sale.

First prize awarded to Laura E. Rice, Midland County, Michigan, 403 2-15 bushels.

Second prize awarded to Fannie Rupert, Douglas County, Kansas, 401 11-12 bushels.

Third prize awarded to Jane Hewitt, Mitchell County, Kansas, 400⅜ bushels.

Fourth prize awarded to Mrs. A. B. Cogwin, Oneida County, New York, 400 bushels.

Fifth prize awarded to Mrs. Myra L. Parsons, Bay County, Michigan, 400 bushels.

Sixth prize awarded to Lizzie Mahony, St. Lawrence County, New York, 399⅛ bushels.

Seventh prize awarded to Mrs. S. J. Eyerly, Fulton County, Illinois, 398 2-3 bushels.

Eighth prize awarded to Sophia E. Adams, Smithville, Ontario, Canada, 396 bushels.

Ninth prize awarded to Mrs. S. H. Calkins, Clinton County, N. Y., 396⅜ bushels.

Tenth prize awarded to Mrs. Betsy B. Colby, Merrimack County, N. H., 393⅛ bushels.

Ten prizes of one pound each of Read's Red Giant not yet offered for sale.

First prize awarded to Mrs. J. A. Childburg, Skagit County, Washington, 392 bushels.

Second prize awarded to Mrs. A. M. Rouse, Boone County, Ky., 390⅜ bushels.

Third prize awarded to Mrs. F. Willis, Washington County, N. Y., 390 bushels.

Fourth prize awarded to Annie E. Harrison, Franklin County, Kansas, 390 bushels.

Fifth prize awarded to Mrs. Thomas Geddie, Brant County, Ontario, Canada, 389⅛ bushels.

Sixth prize awarded to Mrs. J. W. Roberts, Monmouth County, New Jersey, 388 5-6 bushels.

Seventh prize awarded to Mrs. O. J. Putnam, Worcester County, Massachusetts, 387 2-5 bushels.

Eighth prize awarded to Miss Hattie B. Colby, Merrimac County, New Hampshire, 386⅜ bushels.

Ninth prize awarded to Mrs. A. R. Wright, Mecosta County, Michigan, 385⅛ bushels.

Tenth prize awarded to Mrs. A. M. Parsons, Choteau County, Montana, 384 bushels.

Ten prizes, $1.50 each of seeds of any kind, to be selected from their 1890 catalogue.

First prize awarded to Mrs. R. J. Evans, Eau Claire County, Mich., 380 bushels.

Second prize awarded to Mrs. C. S. Stilz, Sumner County, Tenn., 376 bushels.

Third prize awarded to Elizabeth Lawrence, Jefferson County, Iowa, 376⅜ bushels.

Fourth prize awarded to Jessie B. Adams, Kalamazoo County, Mich., 375⅛ bushels.

Fifth prize awarded to Mrs. J. N. Muncey, Buchanan County, Iowa, 373 9-10 bushels.

Sixth prize awarded to Mrs. Henry Beythan, Saginaw County, Michigan, 372 bushels.

Seventh prize awarded to Mrs. Maria Watts, Henry County, Iowa, 368⅛ bushels.

Ninth prize awarded to Mrs. Emma A. Heckman, De Kalb County, Illinois, 366 bushels.

Tenth prize awarded to Mrs. J. H. Valett, New London County, Connecticut, 360 bushels.

Toledo Blade Toledo, Ohio, $5 in five yearly subscriptions.

First prize awarded to Mrs. J. N. Ballinger, Logan County, Ohio, 360 bushels.

Second prize awarded to Mrs. M. E. Carter, Wythe County, Virginia, 360 bushels.

Third prize awarded to Annie Evendon, Yam Hill County, Oregon, 360 bushels.

Fourth prize awarded to Mrs. E. Blagden, Wentworth County, Ontario, 360 bushels.

Fifth prize awarded to E. C. Stirling, Chester County, South Carolina, 360 bushels.

S. Frogner, Herman, Minn., $20 in potatoes, as follows: The pound prizes to be sent post paid: the pecks to be sent by express at recipient's expense. Nine prizes of one peck each of Early Minnesota (new).

First prize awarded to Mrs. Susan Groff, Frederick County, Maryland, 359 1-3 bushels.

Second prize awarded to Mrs. Phebe Kuder, Medina County, Ohio, 358 2-3 bushels.

Third prize awarded to Mrs. W. P. McManus, Chautauqua County, New York, 356 bushels.

Fourth prize awarded to Mrs. M. H. Pitkin, Washington County, Vermont, 353 1-3 bushels.

Fifth prize awarded to Lizzie Johnson, Cattaraugus County, New York, 352 bushels.

Sixth prize awarded to Mrs. K. Farrington, Buffalo County, Wisconsin, 350 bushels.

Seventh prize awarded to Rose E. Haight, Orleans County, New York, 350 bushels.

Eighth prize awarded to Mrs. H. O. Nash, Jefferson County, Montana, one-twentieth acre, 348 2-3 bushels.

Ninth prize awarded to Mrs. R. Morrell, Berrien County, Michigan, 348 2-3 bushels.

Ten prizes of one pound each of No. 18 (not for sale.)

First prize awarded to Mrs. C. H. Warner, Jefferson County, Missouri, one twenty-first acre, 348 3-5 bushels.

Second prize awarded to Mrs. M. Manders, Faribault County, Minnesota, 347 2-3 bushels.

Third prize awarded to Drusilla J. Young, Suffolk County, New York, 346 2-3 bushels.

Fourth prize awarded to Mrs. F. H. Nye, La Crosse County, Wisconsin, (1-29 acre), 342 bushels.

Fifth prize awarded to Mrs. Maggie M. Armour, Victoria Road, Ontario, Canada, 342 bushels.

Sixth prize awarded to Mrs. E. E. Stine, Summit County, Ohio, 340 bushels.

Seventh prize awarded to Miss Leila M. Young, Suffolk County, N. Y., 336⅛ bushels.

Eighth prize awarded to Mrs. J. E. P. Randlett, Belknap County, New Hampshire, 336 2-5 bushels.

Ninth prize awarded to Maria J. Hopkins, Crawford County, Pennsylvania, 336⅜ bushels.

Tenth prize awarded to Alice Gaston, Reno County, Kansas, 335 7-15 bushels.

Ten prizes of one pound each of No. 64 (not for sale).

First prize awarded to Mrs. D. A. Starr, New London County, Connecticut, 334 bushels.

Second prize awarded to Mrs. Mary Wharton, Iowa County, Iowa, 334 bushels.

Third prize awarded to Mrs. M. M. Sornborger, Shasta County, California, 333⅛ bushels.

Fourth prize awarded to Mrs. J. A. Brace, Orleans County, New York, 333⅛ bushels.

Fifth prize awarded to Elizabeth F. Andrews, Wythe County, Virginia, 332 bushels.

MISS SARAH A. SMITH.

WINNER OF NINTH PRIZE. FIG. 301.

Sixth prize awarded to Mrs. George A. Newcomb, Cattaraugus County, New York, 330⅜ bushels.

Seventh prize awarded to Mrs. W. J. Walker, Worcester County, Massachusetts, 330 bushels.

Eighth prize awarded to Mrs Thomas Wilde, Ottawa County, Michigan, 329 3-5 bushels.

Ninth prize awarded to Miss Mamie Groff, Frederick County, Maryland, 329⅛ bushels.

Tenth prize awarded to S. A. Woodburn, Whiteside County, Illinois, 328 7-30 bushels, on 1-29 acre.

Fifth prize awarded to Mrs. Wm. Benson, Adams County, Illinois, 323 17-30 bushels.

Sixth prize awarded to Mrs. A. J. Fulkerth (No address) 324 bushels.

Seventh prize awarded to Fannie S. Kenyon, Fairfax County, Virginia, 322 2-3 bushels.

Eighth prize awarded to Mrs. Charles C. Dimon, Suffolk County, N. Y., 321⅛ bushels.

Ninth prize awarded to Samantha R. Hearn, Williamson County, Illinois, 320 bushels.

Tenth prize awarded to Mrs. Eugene G. Horton, Suffolk County, N. Y., 320 bushels.

Mrs. D. Haskell, Exeter, Scott County, Illinois, $5 in 12 prizes one dozen each of mixed tulip bulbs, to be sent post paid.

First prize awarded to Daisy Turck, Oswego County, N. Y., 320 bushels.

Second prize awarded to Mrs. H. H. Alley, Essex County, New Jersey, 312½ bushels.

Third prize awarded to Miss Minnie Muller, Otter Tail County, Minnesota, 308 2-3 bushels.

Fourth prize awarded to Mrs. Phebe M. Sheldon, Sheboygan County, Wisconsin, 308 bushels.

MRS. MARY E. WARREN.

WINNER OF SIXTH PRIZE. FIG. 302.

Ten prizes of one pound each of No. 50 (not for sale).

First prize awarded to Julia Osborn, Rensselaer County, N. Y. 328 1-15 bushels.

Second prize awarded to Mary Brown, Story County, Iowa, 328 bushels.

Third prize awarded to Phebe Oldroyd, Hampden County, Massachusetts, 326 bushels.

Fourth prize awarded to May Greethurst, Winona County, Minnesota, 326 bushels.

Fifth prize awarded to Nellie Brown, Story County, Iowa, 308 bushels.

Sixth prize awarded to Mrs. H. A. Horton, Emmet County, Michigan, 307⅛ bushels.

Seventh prize awarded to Mrs. Alfred Cook, Grafton County, New Hampshire, 306 2-3 bushels.

Eighth prize awarded to Lillian Shaw, Chase County, Kansas, 306 2-3 bushels.

Ninth prize awarded to Mrs. John Aldons, Welland County, Ontario, Canada, 306 2-3 bushels.

Tenth prize awarded to Ruth Jones, Washington County, Wisconsin, 305⅛ bushels.

Eleventh prize awarded to Mrs. Dennis M. Johnson, Erie County, New York, 304¼ bushels.

Twelth prize awarded to Mrs. C. M. Maxwell, Chautauqua County, New York, 304 bushels.

M. Murray, Centre, Ohio, five premiums, each consisting of two pounds of Ross's Favorite Potato (new.)

First prize awarded to Mrs. Janette Potter, Ontario County, New York, 303⅜ bushels.

Second prize awarded to Mrs. F. L. Avery, Middlesex County, Massachusetts, 305½ bushels.

Third prize awarded to Mrs. W. H. Cameron, Jewell County, Kansas, 303⅜ bushels.

Fourth prize awarded to Mrs. G. B. Grantier, Cattaraugus County, New York, 302 2 3 bushels.

Fifth prize awarded to Mrs. Wm. Middlemiss, Delaware County, New York, 301⅜ bushels.

Mrs. O. J. Putnam, $1 in one dozen bulbs of Freesia refracta alba.

Awarded to Mrs. M. M. Cable, Lincoln County, South Dakota, 301 1-3 bushels.

MRS. ELIZA DAY'S REPORT (FIRST PRIZE.)

The plot was 33x66 feet. The land was flat, sandy, naturally well drained. Strawberries had been raised on it for the previous three years and yielded good average crops. No fertilizer or manure was used. The ground was plowed on April 18th, five inches deep. The potatoes were planted on April 25th in trenches six inches deep, in rows two feet apart, 10 inches apart in the row; weight 120 pounds; variety Early Vermont; number of eyes in a piece, two. The weather was dry and cool. The vines were injured by frost on June 6. The crop was cultivated with the hoe on June 15 and July 3. The vines grew to a hight of 34 inches, and were three-fifths of an inch in size. They bloomed July 10 and were killed by frost on September 10. Beetles did no injury. The crop was harvested in September. There were 2,914 pounds or 48 bushels 33 pounds of marketable tubers, and 134½ pounds or two bushels 14½ pounds of unmarketable; total number of bushels 50.79, or at the rate of 1,015 4-5 to the acre. The tubers are shapely and smooth, the eyes medium. In raising another crop I would proceed in the same way except that I would make the rows two feet six inches apart. The crop was irrigated twice. The season was the most unfavorable we have had for eight years.

I do hereby affirm that the report herewith sent the R. N.-Y. is true in every particular. MRS. ELIZA DAY.

Johnson County, Wyoming.

We do hereby affirm that we measured the plot of Mrs. Day and found it of the exact area she states. We further affirm that we saw the potatoes dug and weighed as they were dug and that her statement is correct.

Signed: T. J. KEESEE.
W. J. STURGIS.
SID. S. STURGIS.

MARY RUSK'S REPORT (SECOND PRIZE.)

The plot was 33 feet square. It was a rolling, sandy, dry soil naturally drained. It had been a hog-pen for three years. The following year it had been under turnips and a large crop was harvested. The following year large crops of cabbages and tomatoes were raised on the same plot. I used no fertilizer whatever. The land was plowed on April 10th, seven inches deep. On the same date it was harrowed and rolled. Before the trenches were made it was thoroughly worked up with a triangular hoe, and the trenches were made with the same. The potatoes were planted on April 13th. The variety was the Chicago Market. The potatoes planted were of ordinary size, containing two to three eyes each. The weight of potatoes planted was 38½ pounds. They were freshly cut and planted in trenches four inches deep and 13 inches apart. The rows were two feet apart and the pieces were covered with a hoe. The weather was wet and cool. The crop was cultivated once on May 9th with the potato-digger, going about six inches deep between the rows. The plot was covered with straw on May 11th. The vines were three feet high and the stems two inches in size. They bloomed May 30, and began to die July 29, and were dead August 30.

London-purple applied once with a watering pot was used to kill the Colorado beetles. The crop was harvested September 4. Total yield 24 bushels and 16 pounds; or at the rate of 970.66 bushels to the acre. Four bushels and six pounds were unmarketable. The tubers on the average were smooth and shapely with rather deep eyes. If I were to engage in another contest I would proceed in the same way.

I do hereby affirm that the report herewith sent the R. N.-Y., is true in every particular. MARY RUSK.

Madison County, Ill.

[The above report, as well as those which follow, are all properly certified to.—EDS. R. N.-Y.]

EMMA HISSAM'S REPORT (THIRD PRIZE).

THE size of the plot was 33x66 feet. The land was flat, clayey and dry and drained naturally. Wheat had been raised on it for the previous three years and yielded 15 bushels to the acre. No fertilizer or manure was used. It was plowed in August, 1888, six inches deep; three loads of manure were applied. Two loads of horse manure each cost 50 cents, and one load of chip manure, 50 cents. The potatoes were planted on April 28, 1889. The "seeds" averaged about seven ounces each and averaged 16 eyes apiece. The total weight of the seed was 90 pounds. They were planted in trenches six inches deep, and three feet 10 inches apart, and were dropped eight inches apart in the trenches. The trenches were made with a two-horse sulky plow. The seed potatoes were cut into four to eight pieces each and the pieces were covered three inches deep with soil. The variety was the Late Rose. The vines were up on May 25, and were frozen to the ground on May 30, but they were up again on June 6. The ground was plowed out with a No. 4 shovel sulky plow on June 11, and the crop was hand-hoed on June 15. We had a very, very dry season and the weather was hot through July and August. The potatoes were plowed again on June 25. The vines were 2½ feet high and the stems half an inch thick. They were in bloom on July 15. The crop got level cultivation, and the ground was plowed shallow. The vines began to die on September 1, and the frost killed them on September 16. No potato beetles troubled them. The crop was harvested on September 24, and the yield was 46 bushels, one peck or at the rate of 925 bushels per acre. Of this quantity 42¼ bushels were marketable and four bushels were unmarketable. The tubers are large, smooth and shapely, with deep eyes. If I were engaged in another contest I would use for a fertilizer chip manure, and leached ashes half and half. I would also plant the potatoes in trenches 8x30 inches apart. Mine were too far apart one way. The following shows the cost of the crop.

Cost of labor, first plowing five cents; plowing the trenches two cents; dropping the potatoes 10 cents; covering them with soil 10; cultivating twice 10; hoeing them once 50 cents; harvesting 75 cents; cost of seed 35; total: $1.97.

I do hereby affirm that the report herewith sent to the R. N.-Y. is true in every particular. EMMA HISSAM.

Steele County, Minn.

MRS. M. J. COVELL'S REPORT (FOURTH PRIZE).

THE soil was sandy. It was an old strawberry bed, and had been plowed after the strawberries were picked, and planted to pickles. A load of hen manure was put on it and it was again plowed the past spring, harrowed and furrowed out with a small shovel plow. The ground planted was 16½ feet wide, and 66 feet long. The "seeds" were planted one foot apart and the ground was cultivated three times and hoed twice. I pulled all the weeds by hand, letting none grow. I worked at them until the vines covered the ground. I hand-picked the vines, destroying every egg and bug that I could find. The crop was dug on October 10 and the yield was 1,380 pounds. Rural Blush and the Green Mountain were the kinds planted, and the tubers were mostly cut one eye to a piece.

Erie County, Ohio.

AGNES C. CAMERON'S REPORT. (FIFTH PRIZE.)

The size of the plot was 33 feet square. It was a flat, clayey, dry piece of land, drained naturally. It had been a calf pasture and was plowed six inches deep. Four wagon-loads of barn-yard manure were put on it. On April 16, 40 pounds two ounces of the Beauty of Hebron and Rural Blush Potatoes were planted six inches deep, in drills. After the vines had appeared a heavy frost, in May, killed them all down to the ground. The spring was very wet and cold. We had more or less rain nearly every day up to wheat harvest. Since then the weather has been warm and there has been very little rain. The crop was hoed twice. The seed-pieces were planted four to five feet apart, and we all thought there would be no potatoes as the vines were so large. They began to die about the first week in August and were dead at the end of the same month. There were no beetles. The crop was harvested on September 18, and the yield was 1,282 pounds, of which 1,260 pounds were marketable and 22 pounds unmarketable. The tubers were very fine and the largest we ever raised. They were smooth and of good shape, with shallow eyes and no scabs. If I had to engage in another contest, I would make no change in my method of raising the crop. The work was all done by myself.

I do hereby affirm that the report herewith sent to the R. N.-Y. is true in every particular.

Texas County, Mo.

MARY E. WARREN'S REPORT (SIXTH PRIZE).

MY little plot was just one-fortieth of an acre. There were 11 rows 33 feet long. The land gently inclined to the southwest and was a gravelly loam, naturally drained. It was formerly planted to tomatoes, beans, corn, onions, beets, etc. About 150 pounds of Chittenden's complete fertilizer were used, costing at the rate of $45 per ton. The plot was planted April 10 and 11, with White Flower Potatoes of medium size n trenches, strictly *a la* R. N.-Y. The weather from planting time until harvest was rather wet and warm. The plot was cultivated first with a spading fork as deep as the tines would permit, and half a dozen times with a steel rake. The average hight of the vines was 2½ feet and the size of the stems about that of the index finger. They began to die about July 10, and were quite dead on the 20th of the same month, when they were dug and weighed, there being 1,215 pounds or 20 bushels and one peck, which is at the rate of 810 bushels per acre. The tubers were very shapely and the eyes were not deep. I think the potatoes were all marketable except two bushels. Paris-green was used once in solution. The flea-beetle invaded the plot once; but a good dressing of unleached wood-ashes was used with good effect in driving the pests off. If engaged in another "contest," I hardly know wherein I would proceed differently.

I do hereby affirm that the report herewith sent the R. N.-Y. is true in every particular. MARY E. WARREN.

Fairfield County, Conn.

MRS. MARY A. PRESLEY'S REPORT (SEVENTH PRIZE).

THE plot was 33 feet square or exactly one-fortieth of an acre. The land was a rich, black, sandy loam, rather flat but thoroughly underdrained with tile drains. For the previous six years celery had been grown on it and it was always of the very best quality. The plot has been fertilized every year for the past 13 years, receiving a very heavy coat of stable manure each year, besides ashes, bone dust, nitrate of soda, hen manure, etc. It was plowed April 16, about 12 inches deep. The year before it had received a very heavy application of stable manure—as much as it was possible to plow under—and last spring it got another coat of fine, well-rotted manure and a dressing of 20 pounds of Mapes's Potato Manure was put in the trenches, over the seed-pieces The cost of the manure was 25 cents, that of the fertilizer about 42 cents. Over 66 seed-pieces of the Rural New-Yorker No. 2 Potato were planted May 4, in two rows. There were also two rows of Rose's Beauty of Beauties, and seven of New Queen, making a total of 363 pieces, or hills. The seed was cut so as to average three eyes to a piece, and weighed about 33 pounds, when first cut. The pieces were cut 10 days before planting time and were planted after the R. N.-Y's. trench system, the trenches being four inches deep and exactly three feet apart. The seed-pieces were dropped exactly one foot apart. The weather was very unfavorable at the time of planting and down to May 29 it was very dry. Then there was a very severe rainfall, lasting three days, during which time about five inches of rain fell. It was followed by cold, frosty weather. During June and up to the first week in July the weather was quite favorable; but from that time down to the date of digging it was very dry. In fact we had the worst drought that has visited this section in 18 years. The crop was cultivated deeply with a Planet Jr. horse hoe just as the vines were nicely up. Afterwards a Matthews hand-cultivator was used once a week until the vines had become too large to allow us to get through. The plot was hoed three times—once when the vines were all nicely up, again when they were about six inches high, and the last time when about a foot high, and a very little earth was drawn towards them. The vines were very vigorous, especially those of the Rural No. 2, which grew fully 3½ feet high; those of the Queen were about 36 inches, and those of the Beauties 30 inches. The Queens blossomed about July 1; the others did not blossom. The vines of the Queen and Beauty of Beauties died down about August 12; those of the Beauties were considerably injured by flea-beetles. The Rural No. 2 did not commence to ripen until the latter part of August, and the vines were dead September 9, when the tubers were dug. The crop was not, to any great extent, injured by the flea-beetle, although I found the pests on the vines; but the latter grew so strong that the beetles did not injure them much.

The old beetles were picked off in the spring as soon as they appeared and hand-picking was practiced until the vines were so large as to prevent it. There were not many young bugs, and two light applications of Paris-green and plaster were dusted on the vines, after which no trouble was experienced. The crop was all dug on September 9. Altogether there were 19 bushels and nine pounds, 17 bushels of which were marketable while two bushels and nine pounds were unmarketable. The Rural No.2 yielded best as follows: 66 pieces gave four bushels of marketable and only nine pounds of unmarketable tubers, or at the rate of 960 bushels of marketable potatoes per acre; 66 pieces of Rose's Beauties gave 2⅓ bushels, one half bushel of which were unmarketable, or at the rate of 440 bushels of marketable tubers per acre; 231 pieces of the New Queen gave 12½ bushels, 1½ bushel of which were unmarketable; or about 690 marketable bushels per acre. The Rural No. 2 were the handsomest, being very large and smooth. The Beauties were inclined to be rough and somewhat unshapely. The Queens were larger and smooth. If engaged in another "contest," I would plant my plot entirely with the Rural No. 2 and would use at least 1,500 pounds of the Mapes fertilizer per acre; but I would make no other change. All the work was done by myself with the exception of plowing, cultivating with the horse and applying the Paris-green.

I do hereby affirm that the foregoing report is true in every particular.

St. Clair County, Mich.

MRS. DANIEL DUNN'S REPORT. (EIGHTH PRIZE.)

THE plot was 33x33 feet. The land was in potatoes last year. A good coat of mixed stable manure was spread in the fall and plowed under in the spring. The plot was planted on May 28, according to the R. N.-Y.'s trench system in trenches six inches deep and two feet apart, the pieces being 16 inches apart. The latter weighed about four ounces apiece and not more than two eyes were left in each. The variety was the White Elephant with a few White Stars. The trenches were half filled, then a barrel of fresh, hard-wood ashes was spread broadcast in them; then all were leveled. When the vines were in bloom I put about a bushel of hen droppings amongst them. The crop was dug on September 25. The Elephant was the more productive. There were 17 bushels of large tubers and 59½ pounds of small ones, from the size of a hen's egg down, making in all very nearly 18 bushels.

Algoma, Ontario, Canada.

SARAH A. SMITH'S REPORT (NINTH PRIZE.)

THE plot was 33x33 feet. It was a clay loam, flat, rather moist and naturally drained. In 1886 it was manured with one ton of barn-yard manure and planted with garden peas. The yield was fair, but was not measured. In 1887 it was planted with sweet corn and two handfuls of pure hen manure were put in each hill. The yield was very poor, the ears being small and not well filled. The manure was supposed to have been too strong. In 1888 the plot was planted with garden peas, but was not manured. Owing to wet weather the peas did not germinate. It was cultivated twice during the summer to keep down the weeds. On May 4, 1889 it was measured and 44 bushels of well rotted manure were spread upon it. It was plowed eight inches deep. The manure was valued at $2, and a dressing of ashes at 50 cents, making the total value $2.50. On May 11 trenches were dug seven inches deep, one foot wide and three feet apart from center to center. The bottom was loosened up about an inch deeper with a forked hoe. Thirty pounds of the Empire State were planted about six inches deep, the pieces being of the size of a hen's egg, and averaging three eyes each. There were in all 363 pieces. The weather was wet and cold, August being the wettest month known for years. On June 11 the potatoes were hoed, and on June 17, 95 pounds of unleached ashes were scattered

A SUMMER OUTING IN THE NORTH CAROLINA MOUNTAINS.

IV.

MARY WAGER-FISHER.

A Methodist preacher and his wife; Jim, the driver; "Charlie;" Dillsboro; a chalybeate spring; Franklin; a mountain hotel.

WE were five hours in traveling the 52 miles that lay between Asheville and Dillsboro, on the Western N. C. R. R. It was a heavy grade for the engine to climb, but the speed was great enough for so novel a route. A very gentlemanly and intelligent man who, on the sly, whisked a quid of tobacco out of his mouth to talk with us, gave us considerable information about the region with which all his life he had been familiar. He proved to be a Methodist preacher, and at one of the stations his wife and four boys joined him. His wife had a

pleasing face, and that cordial, "friendly" manner that characterizes Southern people and makes them so lovable. She had a box of plants in which she was interested, particularly a cutting of the Storm King Fuchsia. She said she never saw a new plant without straightway wanting one like it; and she seemed much pleased when some one on the train told her that her flower-borders at home, from which she had been absent for three weeks "with the boys," were looking well.

We reached Dillsboro at one o'clock in the afternoon. Here we were to have dinner, and then leave in a "hack" (stage) for Franklin, the county-seat of Macon, a distance of 21 miles, over the mountains. All along the railroad are structures called hotels, which are actual or prospective summer or health resorts. At Dillsboro there is a chalybeate spring, of which we drank, and the location of the few buildings there is quite attractive. My trunk had been quietly reposing in the railroad station at this point for the past 10 days, but no charge was made for storage. I had been a little "concerned" about the stage ride that confronted us, and was very much pleased when a fair-faced young fellow, 18 years old, and with beautifully white teeth, came into the train as soon as it halted, and inquired for passengers to Franklin. The Methodist preacher's wife brought him to me, saying: "There is Jim, who will drive you to Franklin, and he is perfectly trusty," and there was no distrusting that frank, manly countenance. He had been over the road "hundreds of times" and knew every inch of the way. At two o'clock his hack with three seats, a cover to the top, and rolled-up side-curtains was ready. The middle seat was given us, as being the most "springy" and two commercial travelers occupied the back one. The baggage followed in another wagon. Our team consisted of one white horse and one mule, and they pulled together harmoniously, regardless of race distinctions

For the greater part of that ride, the road lay through the unbroken forest, and when we were not climbing up one side of a mountain we were going down the other side. There did not seem to have been any method in engineering the road, and that it led in fact to anywhere, had to be taken on faith. At long intervals we passed a log cabin, with barn to match—the cabin sometimes without windows, always small, and the doorway always as full as it could be of babies and grown-ups. One or two habitations, more ambitious than the others, consisted of two cabins connected by a covered passage-way. This insured a sitting-room for the family apart from the kitchen, and as these houses had windows with sashes filled with glass, they indicated the extreme of opulence. At intervals we passed clearings of bottom land, in which men and white women in sun-bonnets toiled side by side. We saw some gardens, principally of onions, which they called "inguns," and some untrimmed peach trees by the roadside were full of fruit. One of the travelers, whom Jim familiarly called Charlie, seemed to know every one along the route, and he gave a brief history of them to his companion. He was himself a mountaineer, and seemed to think their abodes and surroundings good enough. To me they seemed poor and miserable to the last degree. "Charlie" said that a good many now subscribed to a weekly newspaper, which a few years ago was an unheard of thing. When about half the ride was accomplished, we met two men on horseback, armed with revolvers. Jim said they were revenue officers, and were hunting "moonshine" distillers of whisky. The mountaineers like corn whisky, and in proportion so hate the Government officers who endeavor to prevent its secret manufacture that the latter are always in danger of their lives. These two men, and half a dozen "schooner" wagons—wagons with hoops bent over the tops of the boxes and covered with white cotton cloth—bearing sacks of corundum to Dillsboro, were the only travelers we met in that day's ride of 21 miles, which consumed six hours. The road in places, seemed as we looked ahead, utterly impassable and the jolting was so excessive that my arms were almost paral yzed with fatigue, in clutching efforts to save myself from being pitched out by the road-side, or shaken into a jelly. The laddie made various "short-cuts" with Charlie, by the way of trails that ran straighter than the road, and loaded himself with specimens of mica, garnets, and wild flowers. Fortunately the days were then long, and the daylight still lingered as we entered Franklin, where we found a few neatly painted cottages, and even a pond or two stocked with carp. The town occupies a plateau framed in mountains, and was indeed a charming spot. There were two hotels, both pronounced "excellent" by Charlie; though the buildings were rude, they were roomy enough, and had double galleries (piazzas) running across the front, and the "feed" was not bad in the one we stopped at. When we were shown to our rooms, I was so delighted at finding a woven wire "spring" under what passed for a mattress and clean sheets on the bed, that I shut my eyes to other shortcomings. The laddie's bed had no springs, but he didn't mind that, and was asleep in a twinkling. But as I had to have both windows open in order to insure air and as each was as accessible as a door for entrance, I did not feel altogether content in the situation. However, sleep finally came, and neither chickens, pigs, nor cats, came in to disturb us, and the good-natured landlord assured us that we might have slept in perfect safety out on the sidewalk!

ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see if it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.]

BLACK-KNOT; PLUM LICE; KEROSENE EMULSION.

K. N., Hurlock, Md.—1. Some of my apple trees are covered with knots as large as eggs; each one of them seems to be made up of innumerable small ones; what is the trouble and is there a remedy? 2. Last spring the lower leaves and buds of my plum trees were covered with thousands of little black lice or bugs not much larger than the head of a pin, while the under sides of the leaves were black with eggs. I picked off all the affected leaves and burned them, as I had only a few small trees, but this could not be done with large trees; or even with many small ones. What are the pests, and is there a remedy?

ANSWERED BY DR. C. V. RILEY.

1. The knots in the apples are the common black-knot of the plum (Sphœria morbosa) which once in a great while occurs upon the apple. 2. The insects on the plum trees were the common plum lice, of which several species are found upon this tree. (The one in question was, from the description, doubtless Aphis pruni). The best remedy is to be found in spraying the trees with a dilute kerosene soap emulsion made according to the following formula: Kerosene, two gallons—67 per cent.; common soap, or whale-oil soap, a-half pound, water, one gallon—33 per cent. Heat the solution of soap and add it boiling-hot to the kerosene. Churn the mixture by means of a force-pump and spraying nozzle for five or 10 minutes. The emulsion, if perfect, forms a cream which thickens upon cooling and should adhere without oiliness to the surface of glass. Dilute before using one part of the emulsion with nine parts of cold water. The above formula gives three gallons of emulsion and this, when diluted, makes 30 gallons of wash.

ERADICATING GARLIC ON CULTIVATED LAND.

S. W. B., Vira, Pa.—I have seven acres of hillside in which the garlic is so abundant as to make the wheat unsalable. Is there any better treatment than to farm it one year with corn, then with oats for two successive years, seeding down the second year? The field washes badly.

ANSWERED BY PROF. I. P. ROBERTS.

This rotation would not diminish the garlic, while it would subject the field to washing and would leave the land so exhausted as most certainly to endanger the seeding with grass. A better plan would be to plow the land very deep this winter, using a jointer on the plow which should be set deep so that all the bulbs of the garlic will be placed in the bottom of the furrows. Sow to oats in the spring, using not more than two bushels per acre, fertilize liberally with commercial fertilizers—home-compounded or purchased—and seed with a very liberal amount of grasses and clovers as follows: Four pounds of Medium Red Clover, one pound of Alsike, two pounds of Orchard Grass, two pounds of Red Top, and four pounds of Timothy. If the land is inclined to be wet, use no Orchard Grass and double the amount of Red Top seed. In after years fertilize the land liberally so that the grasses and clovers will positively occupy all the land, and, if necessary, sow grass seed from time to time on the weak places. It is a bad practice to cultivate fields filled with garlic unless it is done at the right time and in the best possible manner and with a view of destroying most or all of these objectionable plants. With rich land, abundant grass seed, and good management one can soon see an illustration of the principle of the good crowding out the bad.

A PEAR ORCHARD.

G. W. K., Fisherville, Va.—1. Would it pay to plant 500 pear trees on a heavy clay strong soil? What would be the best varieties for market—the fruit would have to be shipped some distance? 2. What are the addresses of a few reliable nurserymen?

ANSWERED BY N. OHMER.

1. A heavy clay soil is just the thing for pear trees, provided it is well underdrained—wet feet are not good for fruit trees. Judging from my 30 years' experience, it would pay to plant a large orchard of them. I planted 4,000 pear trees, and no tree fruit has paid me so well. I would recommend the following varieties as having been the most regular bearers, and profitable to me: Bartlett, Flemish Beauty, Louise Bonne, Lawrence and Duchesse, the latter as a dwarf. I have many other varieties, but these are the most profitable market sorts. 2 The Storrs & Harrison Co., Painesville, Ohio; Smiths, Powell & Lamb, Syracuse, N. Y.; Ellwanger & Barry, Rochester, N. Y.; N. Ohmer, Dayton, Ohio; Brooklyn Nurseries, Baltimore, Md. The names of other trustworthy nurserymen also frequently appear in our advertising columns.

ABOUT MUSHROOM GROWING.

F. H. B., Peoria, Ill.—1. How soon after planting should mushrooms appear? 2. What is the best temperature for growth? 3. What for growth in young beds? 4. Would too much moisture retard growth? 5. Some of my beds that were planted from the middle to the end of July are producing nothing.

ANS.—1. Everything being satisfactory, mushrooms should appear in from six to seven weeks after planting the spawn, but a full crop should not be expected till the eighth week. 2. From 55 degrees to 60 degrees Fah. 3. The temperature just mentioned is the best at all times and under all circumstances. 4. It will kill the mycelium, hence ruin the crop. 5. Our correspondent does not describe his method of cultivating mushrooms sufficiently for us to be able to give him much information to suit his case: but we may say that July is too early for planting spawn in artificially prepared beds; the end of August is soon enough, and our market growers seldom plant before September.

Miscellaneous.

F. B. C., Springfield, Oregon.—Chas. A. Green, Rochester, N. Y., is secretary of the Nurserymen's Association. Copies of the report can be obtained from him. The price is $1.00. Write to George Wm. Hill, Department of Agriculture, Washington, D. C., for copies of the Department bulletins.

C. S. B., Monroe County, N. Y.—We have used the unleached ashes furnished by Monroe, Judson & Stroup, and believe them to be as good and pure as any of the Canada unleached ashes offered in the market. At least that is our judgment from the ashes sent to us, and from all we have heard from other sources. Their address is Oswego, N. Y.

Discussion.

SMALL FARMS ON LONG ISLAND.

J. E., MELVILLE, L. I.—I have read the letters of the R. N.-Y.'s correspondents in reply to an inquiry as to how a man can make a living on a farm of 13 acres on Long Island. Now, I do not think a man (especially a city man) could make a good living on that much land, even if it was all clear, without some other resources; but I do think a man could make a healthier and better home for his family in the country than he ever could do in a tenement house in New York or Brooklyn. A distance of 20 miles from the city is not too great for a man to attend to his business there and run a small farm too. I have done so for several years and I live nearly twice as far from the city. W. D. Pyles shows a very good record at farming, but he is one in a hundred and he doesn't farm on Long Island. T. T. makes some very true remarks, especially in reference to the Long Island small farmer, but I am of the opinion that he could handle a pen better than he could handle a mattock or a plow or give better advice on legal matters than on practical farming. He says the owner of 12 acres ought, with the assistance of his man—a green German at that—to be able to clear half an acre of his land in a day. Now in my location it is considered hard work for from 18 to 20 days to stump an acre and that too by a man well used to his business. Plowing the stumps out by means of oxen I don't think practicable. It would be difficult to get a plow strong enough or made of the proper shape for the purpose. Such a plow would also turn up too much of the subsoil to the surface, and it would take nearly as long to cut off the roots and knock the dirt off the stumps as to clear the land by hand with the mattock. In my opinion the easiest and best way to clear a small place is to dig it all over with the mattock and get the roots all out. This method is slow but sure, and the land will be left in a good condition for planting. I paid $25 per acre for clearing my two first acres for a garden plot, and when it was plowed and harrowed it looked like an old wooden-tooth harrow turned upside down, with roots sticking above the surface. I next made a machine —something like what house-movers use—and cleared the land with a horse, pulling the stumps out root and branch, one at a time. It left the land easy to plow and in good condition for any crop. I burned the stumps in heaps and spread the ashes before plowing. I have now a nice little farm with good buildings, a wind-mill for pumping water for house and stock, fountain and pond, and as fine an orchard and small-fruit garden as there are on Long Island. Some of the old residents wonder what I do to my fruit trees, they look so healthy and have such fine crops of nice fruit, but as good fruit and farm crops can be raised on Long Island as anywhere, if a man takes the right way to do it. I have been in business in New York for a number of years and have lived on Long Island for the last 15 years. I have raised a large family and improved my place without any help except what has been hired, and I would not live in the city again if I got a house rent-free. There are a great many things a man can make money at outside his farm, and this helps to make both ends meet. There are hundreds of business men building homes and summer cottages all over Long Island and giving employment to hundreds of people, and every year this sort of thing is increasing. I do not depend entirely on farming. I have a good business here besides but what I have learned at farming has been learnt by practical experience, and perhaps a few suggestions from me to the owner of 12 acres might not be out of place.

In the first place, I would advise the owner of 12 acres to start a hot-bed as early in spring as the weather will permit. He should raise all kinds of early plants, including celery and sweet potatoes. He can sell enough to his neighbors to pay for the sashes at least. Let him build a chicken house of 10-inch hemlock boards—a lean-to shed roof is good enough to start with—cover it outside with tar-paper and whitewash it inside. A door and one or two sashes should be put on the south side. He should fence one-quarter or one-half of an acre with wire netting within which to keep his chickens in planting time. When the crops are off let them run where they please. Let him get as many good chickens as he can conveniently attend to. Leghorns are the best for eggs; they are non-sitters and will lay most of the time if properly managed. Eggs always bring a fair price. He should get a couple of full-bred Langshan or Plymouth Rock roosters to cross on his stock for the next season. I prefer the incubator or brooder for raising early chickens for market and home use. It is hard to get hens that will sit early enough. He should also get a couple of early spring pigs; they will be large and fat enough to be killed for next winter's pork. Let him get a good young cow—one after calving or just coming in—and plant some fodder-corn for her. Let him plow two acres eight or 10 inches deep for an orchard and kitchen garden, if it is subsoil plowed, all the better. Half an acre is enough for a garden. As many loads of well-rotted stable manure as he can afford and a few barrels of ground bone should be spread on it, and the whole should be harrowed in until the ground is level and in good order for planting. The apple trees should be 35 feet apart each way, and the peach trees should be set north and south between the apple trees. The latter will come in bearing soon, and by the time the former are large enough to bear a full crop, the peach trees may be dug up, as their usefulness will be over. Potatoes, beans, carrots, beets, parsnips, peas and other low-growing crops may be planted between the rows of apple trees for five or six years. The potatoes should be put in according to the Rural's trench system. Doing so will double the crop and make the land deep and mellow for the tree roots. No grass or weeds should be allowed to grow around trees. The cultivator and hoe must be kept at work and the owner will be surprised to see how quickly the trees will grow and come into bearing. A few rows of dwarf apple and pear trees should be planted in the garden: they will bear in a year or two. Angouleme and Anjou do best as dwarf pears. They should be planted 10 or 12 feet apart in rows with 25 feet between the rows. A few rows of currants, gooseberries, raspberries, grapes and other small fruits should also be set out as well as quinces, plums and cherries. One cannot have too many fruits; they are meat and drink and will save doctors' bills. Garden vegetables should be planted in rows between the trees so that as the owner can plow and cultivate them with the horse a great deal of time can be saved in hoeing and weeding. One should not buy large trees; those two years old are large enough; they will take root better and grow faster than larger ones and cost a great deal less. The inquirer should write this winter to a reliable nurseryman for a catalogue, select what trees he wants and have them shipped in time for planting. He should use good tools. Doing so will save labor and temper and do the work better than poor ones. Agricultural implements are so improved now and so cheap that it would not pay a man to lose time bringing home a lot of old rubbish fit only for the wood-pile or junk-shop. The old fashioned plow is a thing of the past. It would wear out more shoe leather in one season keeping it clean than would pay for an improved one.

Let him buy a Gale or a Boss one-horse plow. The Boss is the best I ever used, it keeps clean and rolls the soil over and covers up the weeds; it can be set to any depth or width of furrow. Three different sizes of mold-boards and shares come with it. It will plow between rows 15 inches apart and the whole costs only about $5. He should get a good steel-tooth cultivator; it will not cost much. A good iron-tooth harrow will answer well enough. The Cutaway is the best for new land, but it is expensive. There are a great many farm and garden tools which a handy man can make at his leisure and thus save time and money. It would be advisable to get a good, steady horse that has worked some time on a farm, if one has to pay a little more for him. As a general thing, the broken-down city car-horse is of little use. For a year or more it is hard to get him to go straight in the plow; he will walk on the plants, tramp on the corn hills, go too fast or not at all, and tear things to pieces. If extra help is needed a man who understands the business would answer the purpose best even if one has to pay him a little more wages. A poor workman, either mechanic or laborer, is dear at any price. The above gives my experience in men, horses and tools. One should not take too much stock in what every one does or says. He should read some good agricultural papers, like the R. N.-Y., and study Nature and paddle his own canoe. He should not give up his business until his place is in good cultivation unless he can find something that will pay him better in his neighborhood.

SELLING DAIRY COWS A GOOD BUSINESS.

J. J. M., WHIPPANY, N. J.,—A recent article on the raising of calves for milch cows in the dairy districts which supply New York City with milk is a good one. It is almost impossible to buy good cows any more. I speak from experience both in buying and selling, for I have done both. Sixteen years ago I began handling milch cows. I bought them in Pennsylvania, and New York State and sold them in New Jersey. Most of this stock came from Susquehanna, Wayne and Bradford Counties, Pa., and from Broome, Chenango, and Cortland Counties, N. Y. At that time such a thing as a creamery shipping milk to New York City from that section was not known, and in fact there were no creameries there to do it. The farmers kept from 10 to 30 cows each and made butter, raised calves and fed hogs. In the fall or spring, as a matter of course, they would sell some stock—generally cows or two-year-old heifers—and they would sell good ones for two reasons: they needed the money and they did not want to get over-stocked, as the calves and yearlings were coming on to take the places of the cows sold. But how is it now? The creameries have sprung up all through that country and the farmers are selling their milk and in most cases, even buying butter. They are not raising any calves to speak of for lack of skim-milk, and does any one suppose they are going to sell cows that are good for anything now? No, indeed. If one gets any it is the culls, and it is almost impossible to get a good lot of dairy cows out of the drovers' and dealers' lots. Farmers cannot sell what they have not got, and the only way out of this trouble is to raise our own calves. I made up my mind to this years ago, and bought a registered Holstein bull and to-day I have 21 head of half and three-quarter-blood heifers all from good cows. Some of them are milking and the three-year-old grades are holding their own right up with the old cows. Three or four can be raised every year without much trouble, keeping your dairy good in number and quality. It is very important that your bull be from a good milk strain. In fact, much depends on this. I am perfectly satisfied that the Holstein grades are the coming general dairy cow. I do not say this because I have them, but because I think I am right in the matter. They are good cows to hold on to their milk—not go dry six months in the year. I think they are away ahead in this. In conclusion, let me say to the milk producers: Try raising your own cows and I think if you get at it once you will keep at it. Of course, many will say it does not pay to raise calves in this part of the country; but if one raises good stock, it does. If one can get 10 good cows without buying 30 from which to select those 10, he can do more than I can.

HORTICULTURE A SENTIMENT IN IOWA.

PROF. J. L. BUDD, AMES, IOWA.—With an experience of over a quarter of a century in practical agriculture and horticulture in Central Iowa, I have a very high estimate of our possibilities in the way of agricultural and horticultural products of the North Temperate Zone. Hence I regret the appearance of such remarks as the following, which the R. N.-Y. credits, under "What Others Say," to the editor of the Iowa Homestead: "Horticulture in Iowa is a sentiment—corn, grass and live stock give us our daily bread." Very naturally in a new prairie State attention is first given to such mainstays as corn, grass and live stock; and I even admit that the settlers on the virgin prairies often get wedded to the habit of making "hog and hominy" the main articles of diet. But in our older counties we now find tens of thousands of finely fitted-up homes, with shade trees, shelter belts, ornamental trees, shrubs, all the small fruits, and such orchard fruits of the first introduction as do well in our climate. Perhaps in no other part of the Union are the villages and cities better supplied with home-grown small fruits than in Iowa, and the general culture of the small fruits for home use is rapidly extending in all parts of the State. In the central and northern districts the lists of really hardy apples, pears and cherries have been very restricted, owing to the fact that the southwestern fruits of Europe and their seedlings which do well east of the lakes, have failed mainly with us: yet our markets are often oversupplied with summer apples, really excellent native plums and small fruits, and it is now conceded that a new era is dawning in the way of cherries, pears and apples in great variety, that will prove as hardy in tree and as abundant in bearing as the Duchess Apple or four select native plums. With our system of trial stations conducted by the agricultural college and the State Horticultural Society, these new and desirable iron-clads will be rapidly tested and propagated, and the very near future will show fine amateur and commercial orchards in the very counties where corn, grass and stock are now the main staples. Everything having been taken into consideration, we have made wonderful advances in our horticultural transformation of the virgin prairie of a few years ago, and I feel like resenting the charge that our millions of trees for shelter and ornament, our millions of shrubs, our thousands of acres of small fruits, and the present status of the orchard fruits should all be included in the word "sentiment," which Webster says is "a thought prompted by feeling."

A CITY MAN'S EXPENSES.

R. G. B., PATERSON, N. J.—I take a good deal of interest in the various letters published from time to time from the R. N.-Y.'s large staff of correspondents. Just now the communications on the cost of living call for a little comment. I have thought that perhaps some of the readers would like to know what it costs a city man to live, so that they could compare his good things with theirs. In the first place, I earn $16 per week and pay $15 per month for house rent. It amuses me when I read some of the letters which say: "We don't keep any account of vegetables, butter, eggs, milk, etc." Well I will tell them what some of these things cost me: I pay 75 cents per bushel for potatoes; 32 cents per pound for butter; 16 cents per pound for chickens; eight cents per quart for milk; 25 cents for seven eggs, and other things cost in proportion. There is one point in which farmers have a large advantage over us who are "coffined, cribbed and confined," and it is an advantage that, I think very few of them appreciate; that is, the advantage of *family companionship*. I know Mr. Terry appreciates it, and right here let me shake hands with Mr. Terry and thank him for all the enjoyment I have had out of his letters. Now I work from 15 to 16 hours a day Sundays and holidays year after year, and I see little of my family. My children are growing up in a separate world from mine, and my wife sees so little of me that we can hardly have the same partnership such as Mr. Terry speaks of in one of his recent letters.

A MASSACHUSETTS ESTIMATE.

R. J. H., TEMPLETON, MASS.—I have been much interested in the discussion on the cost of living, but have not seen anything from this State. My family consists of two persons—my wife and myself. We have some visitors and help occasionally. Here are our expenses for the four years.

	MEAT AND GROCERIES.	CLOTHES.
1885.	$93.85	$45.81
1886.	55.42	26.90
1887.	58.06	40.52
1888.	69.72	43.02

This table does not include either milk, butter, eggs, or poultry. Neither have I charged myself with the lard or pork fattened on the farm, and usually I kill a young beef creature of which I keep part and sell the rest to my neighbors. We burn about 15 cords of wood per year. That does not appear in the expense account, as I cut it on the farm. The principal items would average about as follows per year: tea, $7; coffee, $2; sugar, $8: molasses, $3.50; flour, $15.50; fresh meat, $10; and the remainder goes for things too numerous to be specified. The above account does not show anything for potatoes or for various other vegetables grown on the farm, as I don't charge myself with them. I think if farmers generally kept strict accounts and gave the farm credit for all of its produce that they used, they would have to admit that farming does pay.

THOSE DESERTED FARMS.

F. L. A., EAST PEPPERELL, MASS.—Do readers of the R. N.-Y. wonder at there being so many deserted farms in New Hampshire and Vermont after reading the prices for farm products given by correspondents from those States in recent numbers? Born and reared on a hill farm in a New Hampshire town, and having spent my time till the age of 30 on one of these farms, I know a little of why they are deserted. I earnestly advise any young man with a few hundred dollars, to invest it elsewhere and not to attempt to bring up the land and repair the buildings, to say nothing of lifting the inevitable mortgage accompaniments on those old farms. One undesirable feature is the long distance at which these farms are located from any good market, and freights and express eat up the profits. As to the local markets, a dozen cucumbers and a peck of green peas would glut one of

them for a week. Wages are low and can't be otherwise, but groceries are no cheaper. If the sturdy sons of New England, brought up to be prudent and thrifty, cannot get a living on these farms, will it be any benefit to those who do live there now to have the vacant farms occupied by Swedes who can live in comfort on what a Yankee would starve on? Let the houses go to ruin and the farms return to the primitive wildernes while there is plenty of land in more favorable locations waiting to be worked.

THAT CHEESE SYNDICATE.

W. H. G., RICHLAND, N. Y.—I can't see how a "backing of English capital" is going to be a detriment to the milk-producers as long as they own the cows. I think the more factories are brought under one management the better it will be for the milk-producers. It will tend to higher prices instead of lower. The management can compel *all* of its patrons to bring the milk in good condition. This will insure a better and more uniform quality of cheese and tend to increased consumption. Prices are usually governed by the supply and demand. It matters little to the milk-producer who furnishes the capital—whether it comes from London or New York. It is only by this system of concentration and organization that the dairymen of this country can control their own business, whether it is that of milk, cheese or butter.

ROAD IMPROVEMENT.

W. V., FRANKLIN, N. J.—I wish to call the attention of the readers of the R. N.-Y. to the RURAL of April 21, 1888, on roads. I was much pleased and instructed with the views of the different parties, especially with those of Mr. Stewart when he says: "A dead level is tiresome to a horse and his driver as well. I have often said that too much perfection in grading too near a dead level is a detriment rather than an improvement to roads." I read that sentence of Mr. S. to a party who had traveled through Europe on a bicycle and said he: "I always preferred the rolling to the dead-level, perfectly graded roads." And I would farther suggest to the RURAL readers that a road machine is getting to be a necessity. The best way to have one is to discuss the thing this winter and at the next town meeting make the necessary appropriations.

MORE ABOUT RATS.

L. A. R., BROOKLYN, N. Y.—Some years ago I read in an English agricultural paper that to destroy field mice the following plan had been successfully tried:

Cut sponge in pieces of about the size of a small chestnut. and fry them in drippings and place them where the mice are troublesome. To get the drippings they have to swallow bits of the sponge. These swell and kill them. At that time we were much troubled with rats in our cellar. We closed the house for two months in the summer, but before leaving I put a plentiful supply of fried sponge where the rats could get it. When we returned there were no rats about, and we have not seen or heard of one in the cellar since.

What Others Say

BRIEFS.

WE have received a potato (Early Rose) from James Haven of Great Falls, Montana, which weighs 2¾ pounds. It measures 9⅜ inches long, 12 inches around the short and 22 inches around the long circumference. It was raised on new land without irrigation. The flesh is solid. A single tuber of the same variety weighed four pounds. It was, however, ill-shapen and knobby.....

IN 1884 the R. N.-Y. offered prizes for the largest potatoes. The first prize was awarded to Jacob Shoudy of Lawrence County, Dakota. In a box sent to this office were 14 potatoes which weighed 38 pounds. There were seven Blue Victors which weighed 23 pounds or an average of three and two-sevenths each. The heaviest was a Blue Victor which weighed 4⅛ pounds, a portrait of which appeared in the R. N.-Y. of January, 1885. It was without prongs and shapely.....

THE second prize went to J. W. Collins of Custer County, Montana. This, which was also illustrated in the R. N.-Y. above specified, weighed 4¼ pounds, being only one-quarter of a pound lighter than the first prize. Though so large, it was an almost perfect specimen of the variety, viz., Early Rose.....

AT the same time E. C. Barrow, Spink County, Dakota, sent a potato weighing three pounds eight ounces, C. W. Bower, Tompkins County, N. Y., a White Elephant, weighing three pounds four ounces.

SEVERAL of these giants were planted the next season in the rich soil of the R. N.-Y. experiment plot, but the yields did not seem to be increased over those given by smaller "seed."....

IT is respectfully submitted that the R. N.-Y.'s trials and reports of new varieties of grapes, currants, blackberries or raspberries, strawberries, potatoes, peas, corn, wheat, forage plants, etc., etc., during the past 15 years have been of great service to the country. The proposition is capable of absolute proof. As has been stated before, it does not follow that because a certain fruit, tuber or vegetable does not succeed well at the Rural Grounds, it may not succeed well elsewhere. The climate of the Rural Grounds is a trying one. It is usually favored with late spring and early autumn frosts. The atmosphere is, moreover, humid, so that varieties of grapes which may thrive in perfection at a high elevation, fail there. Nevertheless, we know of no fruit, grain or vegetable that has been condemned as worthless at the Rural Grounds that has become popular among the masses of the people. New varieties should not be judged by the way they behave under highly favorable conditions, but under those conditions which, taking the country over, are likely to prevail in a majority of cases. We have tried nearly all of Ricketts's grapes—varieties which, it was assumed by many, were to revolutionize grape culture. Our reports were submitted with great reluctance and with the feeling that they would do the R. N.-Y. harm among those who, having seen his varieties at fairs, assumed that they were a long way in advance of any of the old kinds. Time, however, has proven that, except in favored spots, all of his hybrids and cross-breeds are worthless. His Don Juan, Downing, El Dorado, Highland, Jefferson, Lady Washington, Quassaic, Secretary and others were announced with a great flourish. Where are they now as grapes for the million? His Empire State was to take the place of first among hardy white grapes. But there are several of the newer sorts that are far more promising.....

THE R. N.-Y. condemned Durand's Strawberries—varieties that were bred upon the *only* scientific principles, and that, as berries for both home and market use, were to take the place of all other sorts known up to the time of their introduction. Never were strawberries announced with a more confident assurance of their great superiority. Where are they now? They failed in the soil and climate of the Rural Grounds and they have failed generally....

THE R. N.-Y., from its own trials, condemned Teosinte, Brazilian Flour Corn, Prickly Comfrey, Kaffir Corn, Pearl or Cat's-tail Millet; while nearly every kind of sweet and field corn, oats, wheat, peas, etc. has been tried and reported upon for the benefit of our readers. Those who will put themselves to the trouble of comparing similar reports now being made by the experiment stations with these older reports of the R. N.-Y. will find that, *as a rule*, those found decidedly wanting in its experiment grounds will be found wanting in most other similar climates and situations.

LET us make now a brief review of our potato reports. During the past 15 years the R. N.-Y. must have tried as many as 1,000 different varieties. How many of those are popular varieties to-day? The Early Rose, Beauty of Hebron, Pearl of Savoy, Early Ohio, White Star, Early Sunrise, Thorburn, Early Maine, Burbank, State of Maine, Rural Blush, White Elephant or Late Beauty of Hebron and Garfield are the chief among them. The Green Mountain, R. N.-Y. No. 2, Brownell's Winner, Superior, Puritan, Corona Beauty, Alaska, Early Thoroughbred, Sunlit Star, Gov. Foraker, Mrs. Foraker, New Queen, Minister, White Early Ohio, Tonhosks, Delaware, Polaris, Crown Jewel and Everitt are among late or very recent introductions, all of which, as judged by R. N.-Y. reports, are well worthy of trial..

CALIFORNIA RAISINS.—California is beginning to outstrip Spain in the production of raisins, remarks that very valuable journal Bradstreet's. Consul Marston, of Malaga, makes the significant statement that the Spanish vine-dressers who have suffered of late years from the phylloxera have replaced vines that have been destroyed, by American stock. In 1882 the crop of raisins produced in Malaga reached 1,900,000 boxes, of which there were shipped to the United States nearly 1,000,000 boxes. Since that time shipments to the United States have been gradually but steadily decreasing. In 1888 when the total production amounted to about 700,000 boxes, only 112,000 were exported to this country. Mr. Marston adds that many Spaniards predict that the vintage of 1889 will reduce still further the purchases made for exportation to the United States, and that in a few years Malaga raisins will be replaced even for consumption in Spain by those produced in California.....

THE R. N.-Y. has raised Brussels-sprouts the past season in this way: The seeds are sown in drills three or four inches apart and the plants thinned out afterwards as needed. The culture is precisely the same as that given to cabbages. The miniature cabbages after a little frost or so are as tender as cauliflower. Mr. C. L. Allen remarks, in Garden & Forest, that a bushel of sprouts will bring as much, usually, as a barrel of cauliflower. while the yield per acre will not be materially less. It is surprising that Brussels-sprouts are not found in every private garden, as they are among the most palatable of vegetables and easy to grow.....

WILLIAN FALCONER says, in the Albany Cultivator, that there is a current idea that artificially-grown mushrooms are not as good or well-flavored as are natural or wild ones, but this is a great mistake; in fact the contrary is the truth, and there is not a more delicious vegetable on the face of the earth than a plump, fresh, young mushroom. And what a delicacy! Mushrooms are healthful, digestible, nutritious and powerfully invigorating; but they must be used when they are young and fresh.....

Their market value is worth considering. The demand for fresh mushrooms is increasing every day, and the supply has never been nearly equal to the demand. Fresh mushrooms cannot be imported from London or Paris—the two greatest centers of mushroom-growing in the world—so our markets must depend solely upon home-grown produce.....

Many farmers could add mushroom growing to their system of crops with benefit to themselves, interest to their families, and profit all round, and it is a crop particularly interesting to the young people. One requires a team of horses to haul a $10 load of hay to market, but one can put $10 worth of mushrooms into a chip basket and bring it along in his hand, and it isn't too late yet to begin. Shake out or prepare the manure in December, make up the bed at Christmas, spawn it at New Year's, and gather and market the mushrooms in February and March.. .....

HORSE manure and a cellar are all that is needed. The spawn costs only 10 cents to 15 cents a cake and each cake, divided into 10 parts, will plant a square yard of bed and this ought to bear five pounds of good mushrooms at the least. The manure is just as good for farming purposes after the mushrooms have done growing in it, as it was before it was made up into a bed—better, perhaps, for it is better rotted.....

MR. H. M. ENGLE says, in the last A. P. R., that Juniata County, Pa., is having quite a boom in peach culture, in consequence of the enterprise of the Smith Brothers who, 15 years ago, planted a few hundred trees, as an experiment, on land worth $15 or $20 an acre. They succeeded so well that not only Juniata County, but the neighboring counties of Mifflin, Huntington and Blair are now awake to the possibilities of peach culture within their borders. From the nucleus of a few hundred trees reliable reports show that last season $50,000 passed through the banks at Mifflin for peaches.....

THE indications are that Pennsylvania will, at no distant day, not only grow the peaches needed for home consumption, but have a surplus for abroad.....

THE R. N.-Y. has in preparation an entirely new system of market reports which will show at a glance the prices of the staple agricultural products in the leading markets of the country.....

THE average yield per acre of the potato prize-takers of Illinois was 506 bushels; that of Ohio, 519; of Minnesota, 515; of Missouri, 541; of Michigan 447; that of Canada 463; that of New York 379; of Kansas 408, etc., etc.....

ALLUDING to our illustrations and description of the Lincoln Pear, (R. N.-Y. page 755). Mr. A. H. Gaston, vice-President of the Marshall County, Horticultural Society, writes us that the original tree stands seven miles west of Lincoln, Logan County, Ill. and is now 54 years old. It measures 5½ feet around the body two feet from the soil and is 35 feet high with a beautiful, spreading head. "It is," he says; "a complete ironclad." W. E. Jones, a neighbor, has one of its descendants—a sucker taken from it—that is 36 years old, and by reason of better care measures five feet around the body. It has borne annual crops for 30 years. In 1888 it bore the enormous crop of 50 bushels. The fruit ripens in September.

WORD FOR WORD

——PUCK: "The Forestry Congress devotes more of its time to barks than bites."

——AMERICAN GARDEN: "It may be cause, or it may be effect, but we know that where horticulture flourishes there is a prosperous community."

——VERMONT WATCHMAN: "No one who knows Vermont believes that her farm lands are exhausted, or that they cannot be as successfully farmed to-day as at any period in her history. Let any one take a drive through our farming districts, from one end of the State to the other, and he will see evidences of thrift and prosperity which utterly do away with the idea that Vermont land is 'worn out,' or is decreasing in productiveness."

——ATCHISON GLOBE: "If you put your eyes on your neighbor's row, the weeds will grow up in your own."

——N. Y. WEEKLY:

"Young Husband—Seems to me, my dear, this chicken is pretty tough.

Young Wife—I know it is, and I can't understand it at all. I looked in its mouth and could see it hadn't even cut its first teeth yet."

Miscellaneous Advertising.

Rheumatism

We doubt if there is, or can be, a specific remedy for rheumatism; but thousands who have suffered its pains have been greatly benefited by Hood's Sarsaparilla. If you have failed to find relief, try this great remedy. It corrects the acidity of the blood which is the cause of the disease, and builds up the whole system.

"I was afflicted with rheumatism twenty years. Previous to 1883 I found no relief, but grew worse, until I was almost helpless. Hood's Sarsaparilla did me more good than all the other medicine I ever had." H. T. BALCOM, Shirley Village, Mass.

Hood's Sarsaparilla

Sold by all druggists. $1; six for $5. Made only by C. I. HOOD & CO., Lowell, Mass.

100 Doses One Dollar

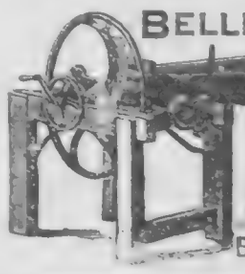
NOTHING ON EARTH WILL MAKE HENS LAY LIKE SHERIDAN'S CONDITION POWDER

Highly concentrated. Dose small. In quantity costs less than one-tenth cent a day per hen. Prevents and cures all diseases. If you can't get it, we send by mail post-paid, One pack. 25c. Five $1. 2 1-4 lb. can $1.20; 5 cans $5. Express paid. Testimonials free. Send stamps or cash. Farmers' Poultry Guide (price 25c.) free with $1.00 orders or more. L. S. JOHNSON & CO., Boston, Mass.

HAY AND STRAW PRESS.

Guaranteed to press **three tons more** of hay in **one day** (10 hours), than any other portable two-horse press, with the same amount of help. Give it a trial. Satisfaction guaranteed, **or no sale and freight refunded.** For conditions, circulars, etc., address

J. A. SPENCER, Dwight, Ill.

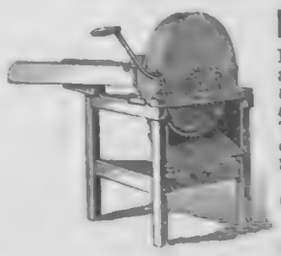


BELLE CITY FODDER and ENSILAGE CUTTER.

All Sizes for Power and Hand use. Carriers of any length. Horse Powers, Etc.

Send for Free Illustrated Catalogue and Price List, with SILO AND ENSILAGE TREATISE

Belle City Mfg Co. Racine, Wis



DICK'S FEED CUTTER

For Hay, Straw and Ensilage. *The only machine that cuts and splits corn stalks.* We also sell the TRIUMPH STEAM GENERATOR, and GRIFFING'S CORN SHELLER AND SEPARATOR. Write us at once. **H. B Griffing, Sons & Co., 70 Cortlandt St., New York City. N. Y.**

SPRINGFIELD ENGINE & THRESHER CO., SPRINGFIELD, O.

THE
RURAL NEW-YORKER,
(34 PARK ROW, NEW YORK),

A National Journal for Country and Suburban Homes.

Conducted by
ELBERT S. CARMAN.

SATURDAY, DECEMBER 21, 1889.

WE hope to present portraits of Mrs. Day, the first prize-taker and Mrs. J. Covell the fourth, with sketches of their lives, in a week or so.

IT will be seen that the first, second, third, fourth, sixth, seventh, eighth and ninth prizes are taken by those who raised their potatoes by the R. N.-Y. trench system.

THE Early Vermont takes the first prize, Chicago Market second, Late Rose the third, Rural Blush and Green Mountain the fourth, Beauty of Hebbron and Rural Blush fifth, White Flower the sixth, the R. N.-Y. No. 2 and New Queen the seventh, White Elephant eighth and Empire State ninth.

MRS. PRESLEY'S potato report (seventh prize) is interesting as showing the comparative yields between New Queen, Rose's Beauty of Beauties and the R. N.-Y. No. 2. The New Queen yielded at the rate of 690 bushels to the acre, Beauty of Beauties 440 bushels and the R. N.-Y. No. 2 at the rate of 960 bushels per acre, while the proportion of unmarketable tubers of the last was very small.

REPORT comes from the West that more sheep will be fattened than ever before in one season this winter. Farmers at the East and South seem to be preparing for fattening the usual number of sheep also, so that it looks now as though prices could not be high next spring. Still, there are hundreds of farms where no better use can be found for fodder and grain than to turn it into mutton, even if prices are lower than ever before.

SOME of our farm writers like to refer to the Western hog as a "walking corn-crib," seeming to believe fully that Western feeders depend upon corn alone for fattening their hogs. Such parties will be greatly surprised when we print a little symposium on "Feeding Oats to Hogs," which is now in preparation. Some of the most noted hog breeders and feeders in the West will contribute to it and it will seriously shake the views of the people who talk about corn-fed pork.

THERE were over 1,000 entries for the Women's National Potato Contest. Of this number 200 are awarded prizes. Wyoming takes one prize (the first). Illinois draws 19 prizes and among them the second. Ohio draws 12 prizes, Minnesota 11, Missouri 6, Connecticut 4, Michigan 15, Canada 8, Washington 4, Nebraska 3, South Dakota 1, New York 23, Iowa 14, Pennsylvania 6, Indiana 9, Wisconsin 12, California 1, Oregon 4, Tennessee 2, Kansas 11, Vermont 2, Kentucky 4, Texas 1, Virginia 4, New Jersey 5, West Virginia 1, Massachusetts 6, New Hampshire 4, Montana 2, South Carolina 3, Colorado 1.

THE "Notes on a Back Number" contest has called out some excellent work on the part of our correspondents. Many of the contributors have never before written for publication, but some of them give promise of valuable work in the future. The R. N.-Y. rather prides itself on the fact that it brings out, each year, a number of new contributors who are splendidly qualified to discuss practical farm matters. This contest will introduce a dozen or more who are well prepared to offer suggestion and advice. The entries for the contest closed on the 20th, and it is expected to publish the essays early in January.

BOTH President Harrison and Secretary Windom advocate the repeal of the tobacco tax. The President, like a truly good man, does not speak of the weed as a necessity; but the Secretary boldly declares that "tobacco has come to be regarded as a necessity by the poor as well as the rich." Would the cheapening of tobacco and the consequent increase of smoking and chewing be really a benefit to the general public, or give relief from the burdens of taxation on a necessary of life? Would the abolition of the tax relieve the producer or consumer or would the whole advantage be obtained by the middleman? Is tobacco an "injurious luxury," or really a "necessity of life?" If the former the tax on it should, of course, be retained; but, if the latter, it should, equally of course, be abolished. Tobacco-growers all over the country favor the repeal of the tax—what do you say?

A SHORT time ago the statement was made that the German authorities were disposed to be less rigorous in their prohibition of American pork and beef. An investigation has been made by the Department of Agriculture with the result of tracing the rumor to a special case where several hundred head of American cattle were subjected to only five or six days' quarantine. Such cattle are ordinarily subjected to five weeks' quarantine. The case mentioned was made special because of a special permit from the Imperial chamber granted in view of the fact that the parties interested had agreed to deliver the cattle without knowing of the quarantine. Strict orders have been given to enforce the regulations, and the consumption of American beef has also been prohibited in the German army. It is not likely, therefore, that we may expect any immediate relief in that quarter. Farmers will feel very friendly towards the administration that can negotiate better trade relations with Germany.

THE publication of the letters describing the "abandoned farms" of New Hampshire has called out a perfect fusilade of correspondence. Some of our readers seem to want to investigate the property with a view to purchasing. Such parties are referred to the Commissioner of Immigration of New Hampshire, who may be addressed at Manchester, N. H. The R. N.-Y. can only say that no one should buy these farms without a personal examination of the premises. A number of persons offer suggestions as to the causes that have led to the decadence in New England farming. Many of the explanations offered are doubtless just. As usual, the R. N.-Y. went to headquarters for information and asked those who owned the farms why the land is to be given up. We believe in getting our information at short range. Another class of correspondents question the R. N.-Y's. assertion that profitable agriculture is possible anywhere near these abandoned farms; in other words, these parties claim that agriculture on the hill farms of New England is forever doomed. We shall see about this later when some of the best farmers of that section have their say.

THERE is something exhilarating about the new Western States. They are so vigorous, so refreshingly earnest that one can't help admiring their actions even if he does not always quite approve. At the last election in North Dakota the Prohibitionists carried a constitutional amendment in favor of their views, and they are now engaged in fashioning a law which is so severe that, as a local paper says: "mankind must reform, drink water or leave North Dakota." The penalty of selling, offering for sale or giving away any intoxicating liquors will be not less than $200 or more than $1,000 for the first offense, while imprisonment for at least one year will make a second offense odious. In buying from a druggist, the purchaser must make an affidavit of the object for which he buys the stuff before every purchase, and the druggists' record of sales must be open to public inspection during all business hours. Public officials are made spies and informers under penalty of loss of office, and meetings of men for convivial purposes are declared unlawful. It is reported that the wicked "wets" are even more anxious than the extreme Prohibitionists to make the provisions of the law more severe. It is likely that North Dakota will be the first State which will teach the world the results of the strictest possible Prohibitory laws.

LAST Thursday there was an interesting story about Wall Street, the hub of the financial wheel of this country. Money was very "tight" and interest on "call" and other short loans extremely high. Why? Neither foreign complications nor the regular harvest flow of money to the rural districts all over the country for the purpose of "moving the crops" could account for it. Investigations threw some light on the enigma. It was found that $12,000,000 cash belonging to the Sugar Trust had been loaned "on call" by the Trust magnates to various banks and trust companies, and that all this money had been suddenly called in. At this season a vast amount of money is taken from New York and other financial centers to set the crops of the country in motion, and a sudden demand for $12,000,000 of borrowed money naturally caused a financial stringency. Some time ago the Sugar Trust magnates sold a large lot of their stock at $100 to $125 per share, by puffing the market. They wanted to get all they could of it back again at a lower price; hence, it is charged, they tightened the money market, thus forcing hundreds who had bought trust certificates for speculative purposes on a margin, to throw them on the market. This caused prices to sink 10 per cent. last Tuesday and 4¼ per cent. more next day, so the wily manipulators were enabled to buy from the dear public at $55 to $60 per share what they had previously sold at $100 to $125 per share. This is called "milking the public," or "shearing the innocents;" what do you think of such highly honorable, financial agricultural operations?

THE sessions of the various representative farmers' organizations at St. Louis closed a week ago. The Northern Farmers' Alliance of Kansas and South Dakota joined the Southern Alliance under the new name of the National Farmers' Alliance; but action was deferred by the delegates from the other Northern organizations until the matter can be submitted to the separate State Alliances. The Agricultural Wheel and the Farmers' Mutual Benevolent Association were also amalgamated with the new organization, which is now the most numerous and ought to be the most influential in the country. The resolutions favored woman suffrage; the reservation of public land for actual settlers; a prohibition of the acquisition of land in the States and Territories by aliens; rigid enforcement of the law against land-grabbing railroads; the free comage of gold and silver; a prohibition of national loans to banks on bonded security at one per cent. interest, while farmers have to pay eight to 10 per cent., and the payment of the national debt as fast as possible. Taxes on real estate and mortgages and a graded income tax were demanded. Strict economy in all public departments was insisted upon, the liquor traffic was opposed in all forms and a revision and reduction of the tariff were strongly advocated. A basis of federation between the Alliance and the Knights of Labor was agreed upon. It is highly probable that the new organization, which claims a membership of over 2,500,000, aided by the Knights, will have a powerful influence on political matters in the near future, as its main objects appear to be of a political rather than of an economic character.

THE American Sugar Company of Kansas has been perpetrating a fraud on the farmers about Mineola and in some other sections, a counterpart of which has not been heard of since the exposure of the notorious electric sugar frauds. About a year ago the company built a mill for a few thousand dollars to manufacture sugar from sorghum at Reade Center. The Adamson or "roasting process" of extracting the sugar was employed and marvelous results were claimed. The product was exceptionally fine and abundant. The farmers became jubilant at the success of the new industry which afforded them a profitable home market for a new "money" crop. Soon the company very persuasively proposed that the different townships should vote bonds for the extension of the works, and bonds to the amount of $90,000 were voted and the script was turned over to the company. At Ashland, Clark County, the same plan was pursued and the farmers readily voted bonds to the amount of $18,000. It is believed that like inducements were successfully used to secure bonds from farmers in other parts of the State, and that $150,000 were obtained in this way. Last Thursday the fraudulent scheme was detected and exposed. A large number of barrels of pure imported sugar had been used in making sirup excellent in quality and remarkably large in quantity from the amount of cane used. The residents of two townships in Meade County flocked to the mill and forced the manager to destroy the bonds; but it is reported that the bonds of the other townships had been negotiated. There is a great deal too much readiness and laxity in bonding municipalities and counties for works of a quasi public character; and, as in all new countries, this pernicious practice is at present most prevalent in the great, enterprising, go-a-head West. The lesson taught by the American Sugar Company should prove a salutary warning to those inclined to risk money in this way.

BREVITIES.

THE judges decided to award no souvenirs for any yields less than at the rate of 300 bushels to the acre.

THE announcements of several promising new varieties of potatoes will be found in the advertising columns of this issue.

"EVERYBODY has it in his mouth that beans are a light crop:" is the report of an old subscriber in Livingston County, N.Y.

"IT will be a good while, I fear, before you get a potato that will equal the Beauty of Hebron and Thorburn." So writes Jonathan Talcott from Rome, N. Y.

THE stock of the Kumerle Dwarf Lima is very small. So also is that of Burpee's Dwarf Lima. It will be offered for sale in very small quantities at a very high price.

IT seems that there is quite a division of opinion regarding the possibilities of a small farm near New York. The opinion given this week, on page 838 is interesting.

SHOULD we have a law compelling manufacturers to state the sources of the nitrogen, potash and phosphoric acid they use in their fertilizers? Some of our wise men will tell us in a subsequent number what they think about this.

AS SOON as possible we shall begin the publication of a series of articles on "Farming 100 acres at a Profit in Western New York." They will be written by a practical farmer and we feel safe in promising our readers something unique, interesting and valuable.

A NUMBER of subscribers write us that they have used coal ashes on light, sandy soils with excellent results. As Prof Johnson pointed out last week, the good effect is due more to the change made in the mechanical condition of the soil than to any great fertility in the ashes.

CONTRARY to the predictions of our entomologists and fungologists, the potato rot ceased just as soon as the potatoes were taken out of the soil. That is to say, though rot in the crop while growing was never before so prevalent, rot in the *harvested* crop is less than usual.

A CITY jeweler of long experience informs the R. N.-Y. that a class of city people every Christmas pay cash for jewelry and dodge the payment of food bills and rent. This is a curious phenomenon of city life and helps to explain the puzzling fact that though the world's supply of diamonds has largely increased, the price has hardly diminished.

SOME insist that the recent drop in the price of Sugar Trust certificates is wholly or in main part due to the opening, the other day, of Claus Spreckel's mammoth sugar refinery in Philadelphia. This has a capacity of 2,000,000 pounds in 24 hours and Claus declares he will run it to its full capacity. The drop in the certificates can affect only a few and those mainly speculators who deserve little sympathy; but what a multitude a drop in the prices of sugar would affect! Have you heard anything of that kind drop?

CANADA unleached ashes of average quality, as shown by 13 analyses made by Prof. Storer, contain 5.77 per cent. of potash, 39 per cent. of lime and 1.17 per cent. of phosphoric acid. Estimating the potash at six cents per pound, the ashes are worth, say, 35 cents (34.62) per 100 pounds and the phosphoric acid (estimated at eight cents per pound) about nine cents. Throwing in the lime as worthless, these ashes are worth 44 cents per 100 pounds. Unleached ashes, however, are a very variable quantity, depending upon moisture, sand and the like.

Field Crops.

R. N.-Y. Womens' National Potato Contest.

(*Continued from Page 836.*)

in the rows and worked into the soil with a pronged hoe. On June 26 the soil was loosened between the rows with a cultivator. On July 8 the vines commenced to blossom. They were about 18 inches high and averaged half an inch in diameter. On September 21 they were killed by frost. Potatoes were not troubled by any beetles at all this year. The crop was dug on September 28, the vines averaging 4½ feet in length when pulled. The yield of marketable tubers was 17 bushels and there was half a bushel of unmarketable ones. The tubers were, on an average, smooth and shapely, and the eyes shallow. In another "contest" I would plant another variety and do so in a higher and lighter soil.

St. Louis County, Minn.

Biographical.

MISS MARY RUSK.

I WAS born July 28, 1863 in Madison County, Illinois, and was left an orphan at an early age. After the death of my parents, I lived with my grand-parents, for several years. Afterwards I lived with a married brother until I was old enough to earn my own living.

I then lived with a family who gave me my board and clothes and sent me to school for about two years. After that I lived with different families, all farmers, until 1881, when I went to live in the family of Mr. Jeffress where I have been ever since. Mr. Jeffress has been a subscriber to the RURAL NEW-YORKER for a number of years, and I of course read the paper. When I expressed a desire to join the Women's Potato Contest, he kindly offered to give me a plot of ground and potatoes enough to plant it. I have done light work, such as dropping corn, planting potatoes, and working among the vegetables, but I never tried to raise a crop before; but the greater part of my life has been spent on a farm.

[Miss Rusk's photograph is reproduced at Fig. 300, page 834.—EDS.]

MRS. AGNES C. CAMERON.

MY maiden name was Agnes Campbell Bell. My parents lived at Newburgh, N. Y., where I was married to John Cameron on September 20, 1870. We then went to New York City. My husband was a plumber by trade, but in 1878 we removed to our present home on a farm. My husband had never worked on a farm nor had I myself done so till we came here. The first year we had to hire all the work done; since that time we have been able to do the work ourselves with extra help at harvest time. I have always helped my husband in planting corn and in hay harvest. I can drive a reaper as well as any man, or a sulky rake, and when I'm wanted for plowing corn, I do so. I always have a large garden on which I pride myself. This is the first contest I ever have worked for. We have always harvested good crops of potatoes. The farmers around would wonder how we could raise so many. We used to tell them they ought to read the RURAL NEW-YORKER and then they could do the same. Corn and wheat were good crops this year. We made a little over 20 bushels of wheat to the acre on clover sod: the average is 10 to 12 bushels to the acre. Corn will average 40 bushels to the acre. It would have been heavier had not frost cut it short. My husband thanks the R. N. Y. for his success in farming. We take four papers; but we think the RURAL the head of all, so we are always anxious for its arrival.

[Mrs. Cameron's picture appears at Fig. 299, first page.—EDS.]

MRS. MARY E. WARREN.

THIS lady was born on October 2, 1839, in what is now the city of Middletown, Orange County, N. Y.—then an ordinary country village. Her father, the late Benjamin Bennet, was a farmer. The original Bennet estate comprised about a square mile of land. The growing village and city has absorbed the whole of it, with the exception of about 10 acres. She was married on November 4th, 1863, and has two sons 17 and 20 years old respectively. The family lives four miles from the city of Danbury and is very pleasantly located, the house being large, convenient, and complete in all its appointments, so that housework is reduced to a minimum. Her husband has retired from business, which was of a professional nature, and devotes his attention mostly to special gardening.

[A picture of Mrs. Warren's may be found at Fig. 302, page 835.—EDS.]

MRS. MARY A. PRESLEY.

I WAS born on a farm in Jefferson County N. Y., April 19, 1823, and am, accordingly, in my 67th year. My father was a farmer from my earliest recollection. I was married on June 14, 1853. My husband "farmed" for a number of years, but for the past 15 years he has found "market gardening" more to his liking. Our crops of course are rather varied, but we make a specialty of growing "fine celery," and have every reason to feel proud of our success. Since we subscribed for the R. N.-Y. we have also grown potatoes with profit. I have always had a taste for horticulture, and I am happiest when working among my flowers. I was never particularly interested in any farm crop until after we had begun to take the RURAL, but after reading of the editor's carefully conducted experiments and experience with potatoes, so fully explained, I said that with such teaching even an "old woman" could raise a "big crop," and when the opportunity came through the Women's National Potato Contest, I gladly availed myself of it, and although the season was a very bad one I carried my point, as my report will show. Had it been a favorable one I am convinced that I would have more than made good the RURAL'S assertion that it is possible to raise at the rate of 700 bushels of "marketable" tubers per acre.

JACK FROST CATCHES MR. POTATO OUT. FIG. 304.

MISS SARAH A. SMITH.

I WAS born on this farm on February 7, 1873. I have grown to a hight of nearly six feet and am strong and healthy in proportion. Living as we do, three miles from town, I believe that the bracing walks to school in the mornings for the past nine years were in a great part the cause of my vigorous growth, as neither father nor mother is above medium size. My first recollection about taking any interest in the farm was when I was nine years old. Then father gave me a patch of ground and seed potatoes enough to plant it. This I hoed and cared for during the summer and harvested a crop of 11 bushels which were sold to father at the current price. Since then I have taken an active part in nearly all kinds of farm work, even to driving the horses in plowing, harrowing or raking hay, either of which jobs I prefer to housework. We have always taken several good papers, among which two or three have been agricultural. I early acquired a liking for the latter on account of my father subscribing for one of them in my name. This I would open and read with more pride than comprehension at first, though I soon began to read it in earnest, and now find an account of some new experiment in farm work of far more interest than story reading.

I was very much interested in the R. N.-Y.'s "contest" a year ago, and when the announcement of the "Women's Contest" was made, I immediately entered my name. Even though I should get no prize I do not regret my work on that "Contest Plot" in the least, for I rather enjoyed it, for it caused considerable merriment among our neighbors, especially when the potatoes were dug.

[A picture of Miss Smith is shown at Fig. 301, page 835.—EDS.]

Educational.

THE WISCONSIN SCHOOL OF DAIRYING.

PROF. W. A. HENRY.

A valuable short but complete course for farmers' sons; its inception and steady increase; specially adapted to farm boys as regards preliminary requirements and nature of instruction; range of subjects taught; students select special subjects for study; continuing studies winter after winter; work practical and attractive in form; having gained a better knowledge of farm operations and the reasons therefor, students learn to love farm life all the more; excellent results hitherto accomplished; bright prospects ahead.

IN reply to an inquiry from the R. N.-Y. relative to our new dairy school, allow me to make a few statements, going back a little in the history of our agricultural department, and including a description of our short course, which is essential to understanding our plan of dairy instruction.

For years our university, like most others that gave agricultural instruction, failed to draw any considerable number of agricultural students, and it was very questionable whether we would ever succeed under the old plan, which provided a long course of four years in agriculture, ranking in requirements for admission and character of studies with the other university courses. We also allowed young men to come and study for a term or more, but did not offer them any special advantages. That is, they were expected to join classes already in existence, and make their way along with them as best they could. The regents (trustees) of the university took the matter in hand a few years since, and directed that a lower, simpler course in agriculture be provided. It fell to my lot to arrange for what we afterwards named the "Short Course in Agriculture," and here let me confess that at first I believed that the plan would not succeed. However, this adverse opinion held by myself, did not prevent the best effort I could make for the new course of instruction, which I believe was really the first of its kind in America. The scheme was to provide teachers from the university force, who should give instruction arranged for the capacity and wants of such young men actually engaged in farming as might desire to secure it by leaving the farm for three months and returning to it again at the end of that period. Other institutions have offered short courses in agriculture, but I believe none, until recently at least, has made a short course *complete in itself* and distinct from all others, for such a purpose as this. We have now given instruction in this line for four winters, and last year had 40 bright, energetic young men with us, every one of whom left the farm to study with us, and hurried back again at the close of the term to continue farm wo

This course has gradually grown, until this winter we offer instruction as follows:

Daily lectures on stock breeding, stock feeding, and general farm operations, by myself; lectures by Dr. Babcock upon agricultural chemistry; by Mr. F. H. King upon soils, drainage, farm buildings, and farm machinery. The persons enumerated have their quarters in Agricultural Hall, and give their whole time up to agricultural investigation and instruction. In addition, students who desire receive training in the machine shop, going through an elementary course in wood-work, such as using the plane, learning to handle the saw, and ending with wood turning; they also receive a course in simple blacksmithing. Our State Veterinarian meets the class three times a week for veterinary instruction. This brings me to the new features offered this winter for the first time.

Having secured Prof. E. S. Goff, late of the New York Experiment Station, and one of the R. N.-Y.'s contributors, as Professor of Horticulture in the university, we have provided him with a fine laboratory, and he will this winter give instruction in horticulture. From the ample preparations he is making, I believe this will be a most instructive and valuable course. The other new feature is a course in dairying. For this we shall expend about $3,000, having built a large two-story dairy-house, with boiler room, etc. In the dairy house will be found as complete a line of dairy machinery and apparatus as we can find, including the butter extractor, centrifuge cream separator, appliances for deep setting, etc. Dr. Babcock will give instructions in handling milk and butter-making. Mr. E. M. O'Connell, a practical cheesemaker of Sheboygan County, who has studied with Prof. Robertson of Canada, and was employed the past season by the State Dairymen's Association to instruct the cheese-makers of his section, will devote his time to instruction in cheesemaking and cheese curing. To accommodate the students in this work we have fitted up a fine laboratory with desks, the same as chemical students use and will provide apparatus whereby they can familiarize themselves with the simple methods of milk analysis, such as Short's method, the lactometer, etc.

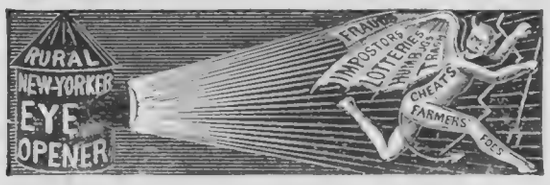
It will be seen that we offer more lines of instruction than any young man can follow in a single winter. We allow each student to choose three or four subjects, and he must adhere to them. Last year seven young men returned to continue work which they could not carry out the preceding winter; this winter we have promises that quite a good number will return for the same purpose.

As this course becomes developed, we see great possibilities for it, and from being skeptical as to the practicability of taking young men of this class into a university, I have come to believe that we have at last found the proper way to build up an agricultural department or college. In our ladder of education we have at last found that the first rounds to be put into it are the lower ones. Our lectures are not very formal, and we introduce just as much laboratory work as possible. I find that our best students do not care to have us teach them how to hold a plow, milk a cow, or sow grain. In coming to us for instruction they are under considerable expense, and most of them say that they prefer to get the reasons for things with us, and that correct practice comes quickly enough when at home. Our instruction is much of the same nature as would be given at farmers' institutes, only, of course, it is greatly superior to that, because each instructor has 60 days' time with his students.

We do not try to make scientists of these young men, but aim rather to make them careful, thoughtful, observing and practical. I have been surprised to watch their development, and note that the majority of them leave us enthusiastic in their vocation, and yet not at all puffed up or holding the idea that they are "college educated." At first it was seriously questioned whether young men of this class could be successfully handled in a university where hundreds of regular students were in attendance. I rejoice to say that during the four years in which this course has been on trial, not a single difficulty of any kind has arisen in regard to such an association. These young men board in the same clubs with university students, and are greatly benefited by meeting those who are engaged in other lines of study and investigation. They have their own agricultural literary society, and come and go without attracting any more attention than do the law students or those studying the mechanic arts. Of course this instruction has cost

the university a great deal in proportion to the numbers taught; but from the small beginning we have gained in numbers each year. I do not think we shall lack for students in the future. Our next term opens January 6, with a promise of a large class with representatives from several States in attendance.

Agricultural Experiment Station, Madison, Wis.



ELECTRIC SANATORY APPLIANCES.—From large transactions to small ones is a frequent step in swindles and humbugs. The Eye-Opener has been frequently asked for an opinion with regard to the numerous "electric," "magnetic," and "galvanic" belts and similar sanatory appliances which glowingly appeal alike to town and country people through advertisements in a multitude of papers. In the opinion of the doctors at Bellevue and New York Hospitals, the principal institutions of the kind in this city, such appliances have in themselves no curative properties, though occasionally they produce good effects through the action of the imagination, just as bread pills and similar inoperative medicaments not infrequently effect unexpected results in a certain class of cases. After consultation with the above authorities, the Eye-Opener has several times written of the matter in this way in this department. An excellent article on "Electricity in Relation to the Human Body," appeared in Scribner's Magazine for November this year. Mr. Allen Starr, the author, is an expert on the subject on which he writes, and has made special investigations into all its phases. Speaking on this subject, on page 598, he says: "The most careful experiments have shown that the human body is as completely insensitive to magnetism and as wholly unaffected by it as a piece of rubber or of wood.

A person may stand between the poles of the most powerful magnet, one which might hold up a ton of iron, without the slightest perceptible effect upon any of the bodily functions being produced. Hence all so-called magnetic appliances, brushes or combs, disks, belts, and magnets have absolutely no curative power whatever * * *. The majority of the effects produced by such contrivances are due * * * to expectant attention rather than to any action of the agents which careful investigations have shown to be inert. The writer," he continues, "once demanded of the agent of a widely advertised 'electric belt' some proof that an electric current was produced by it, and suggested that such a current could be detected by means of a galvanometer. This test was objected to, but a little frame holding a dozen pocket-compasses was at once produced, and the power of the belt, which doubtless contained some iron plates to attract the needles of the compasses, was shown as a proof of the production of electricity in the belt. Probably many who were ignorant of the difference between electricity and magnetism have been deceived by this so-called test."

Woman's Work.

CONDUCTED BY EMILY LOUISE TAPLIN.

CHAT BY THE WAY.

SOMEHOW, it seems as if people more generally regard Christmas as a secular festival rather than the sacred feast it really is; the key-note of Christianity. We are apt to forget that all the mirth and jollity should spring from the primal thought of peace on earth, good will to men. Just as we forget that the idea of the gifts is really a free-will offering of pure love or friendship without any thought of self-interest. When a girl says: "Oh, I must give So-and-so a handsome present; she gave me one on my birthday," we know that whatever her ideas may be, she does not understand the spirit of Christmas at all. If we could only keep Christmas in our hearts all the year round!

* * *

HOW sorry we do feel for the poor little Puritan children, who were taught that Christmas was a Popish abomination. Just think of the harsh spirit that saw sin lurking in a branch of red-berried holly, and all the deceits of the world, the flesh, and the devil beneath a spray of mistletoe. Even mince pies and plum puddings were regarded as an invention of the enemy, an impression in which a dyspeptic might concur, and the glories of the boar's head and the mighty Christmas sausage were past. There is no doubt that the Christmas jollity of olden times resulted in great rioting and debauchery; we may be glad that it is gone. It was really the pagan Saturnalia re-christened; the appointment of the Lord of Misule and the general license permitted point to its heathen origin. These observances are regarded as relics of the Roman Saturnalia, while the use of holly and mistletoe is derived from the Druids, priests of ancient Britain. But from whatever source we borrow its observances, the real spirit of the day comes from Christianity alone.

* * *

Of course the date on which this feast falls is much disputed, but whether the event we celebrate did happen on the 25th of December or not it is enough to know that so many people of differing creeds and tongues agree to commemorate it on this day. In the Eastern or Greek Church they still celebrate the Savior's birth on Old Christmas, the sixth of January, known as the Twelfth Day or Epiphany, but for many a century the great Western Church has fixed on December 25. Twelfth Day commemorates the adoration of the wise men, and in many countries it is regarded as a very festive occasion.

* * *

HOW often have you read "A Christmas Carol?" It is the fashion nowadays to run down Charles Dickens; to call him a caricaturist, and a sentimentalist, even to say that he didn't know how to write a story after all. But if there is not material enough for a half-dozen Christmas sermons in that one story, may we never read fiction again. Think of poor Bob Cratchit, with his shabby coat buttoned over the comforter that took the place of an overcoat, striding home from church with Tiny Tim on his shoulder—poor Tim, with his frail form and his little crutch. But there were peace and good will in the Cratchit household, in spite of poverty and pain, and there was the Christmas spirit in the poor little cripple's after-dinner speech—these simple child-like words come back to us with each recurring season: "God bless us, every one."

AN OLD-COUNTRY CHRISTMAS.

AMONG the confused memories of early childhood is a vague recollection of meeting a bright-faced man, wheeling a barrow decked with red-berried holly, which was piled high with sirloins of beef. Everything surrounding the incident is indistinct now. It was in one of the midland counties of England, on the estate of a great nobleman, and the man with the barrow was distributing the beef and other substantial dainties to all the tenants of the estate, as was the Christmas custom. Christmas is a very much greater occasion there than here, although many of the older customs are now passing into disuse. The house decorations are very much more elaborate there than here, where they rarely pass beyond a wreath or two in the windows. I can remember our house being a perfect bower of evergreens, holly and laurel and mistletoe festooned everywhere; indeed the houses were as much decorated as the churches. There had been much work going on in the kitchen for weeks previous—stoning raisins, washing currants, and chopping candied peel, and we children were all gladdened by the sight of various little mince pies, very smooth and shiny, with the initials of our names on the top in raised pie-crust. We were allowed to sit up a little later than usual the night before Christmas, and we always sat in the big kitchen, with its well-scoured stone floor curiously streaked with soft sandstone, while we watched the pudding boil.

It seems that one cannot boil a plum pudding too long, and ours was always cooked for some hours the night before. There was holly everywhere, and a great bunch, mixed with mistletoe, hung in the middle of the kitchen ceiling. By and by there would be a sound of music outside, and after a song or two, the mummers would enter, expecting a glass of ale and some small money. This is a custom now going out, but years ago it was general. Parties of men and boys, often the village choir, would go about singing from house to house on Christmas eve. Sometimes they dressed in odd masquerade dresses, and acted some little pantomime. The place I recollect was the abode of the redoubtable Robin Hood, many a long year past, and in that locality the mummers used to dress up to represent that hero, singing quaint old rhymes descriptive of his exploits, which had been handed down orally from father to son.

This was really a modern survival of the medieval mystery plays. I remember a party of mummers dressed to represent Robin Hood, Little John, Friar Tuck, and Maid Marian, with their followers. They gave an uncouth dance, in which Maid Marian disported herself so vigorously as to give a passing glimpse of big hob-nailed boots and corduroy trousers. All wore masks, and they were a most motley crew. It was rather a tax sometimes, to be visited by the mummers, there were so many of them, and the hosts would sometimes play practical jokes on them, which were taken quite good-naturedly.

We did not hang up our stockings, for Santa Claus was comparatively little known among us, but our gifts were distributed before breakfast. Our little mince pies appeared at breakfast; after that we went to the bower-like church. At dinner everything else was insignificant in our childish eyes, compared with the pudding—a fragrant, rich brown mass, powdered with sugar, and crowned with holly.

In the evening we played old-fashioned games, old and young joining in blind-man's buff and puss in the corner and we wound up with the excitement of snap-dragon, lucky if we escaped without burnt fingers.

Christmas holidays and festivities were kept up until after Twelfth Day, when the decorations came down, and the season was at an end.

It is pleasant to look back on these old associations, yet at times they are a little saddening. We buy English holly and English mistletoe, and make our Christmas dainties after the old recipes; perhaps it is the Christmas feelings of childhood that we miss, after all. COTTAGE MAID.

GOLDEN GRAINS.

THE INDEPENDENT says that the facts of human life are just what they are, whether men believe or do not believe in the doctrine of a personal God and his government over human affairs. Infidelity as a creed will not change these facts for the better; but it will deprive the soul of all the consolation, comfort and hope derivable from a trustful and loving faith in God. This is an immense loss to any one.....

SEE that little speck of existence in the shape of a man, bursting with angry passion, frothing at the mouth, bellowing and roaring, cursing and swearing, acting as if he were just ready to kill somebody. Look at him. What you see is a fool. The man acts like a fool, and is a fool, besides being a sinner.....

NO MAN or woman, even of the humblest sort, can be strong and gentle and pure and good, without the world being better for it—without somebody being better for it—without somebody being helped and comforted by the very existence of that goodness.....

IF one cannot seriously and soberly think of his own life, and of the issues thereof both here and hereafter, without being miserable, he may set it down as a certainty that there is some radical fault in that life. Sad, indeed, is the condition of that man who can be happy no longer than he can be thoughtless. If he were right himself, then to think of himself would be a source of pleasure rather than of pain....

J. J. GUNDY says: A tree will not only lie as it falls, but will fall as it leans; and the great question everyone should bring home to himself is this: "What is the inclination of my soul? Does it, with all its affections, lean toward God, or away from Him?".....

AN excellent book by Dr. A. J. F. Behrends has just been issued by Baker & Clark. It contains a number of statements which are likely to provoke the antagonism of the theologian—for example Dr. Behrends says:

"It would, perhaps, be more exact to say that the decay of religion is provocative of social discontent, than to charge socialism with originating and propagating hostility against religion.".....

ANOTHER statement not, however, so likely to provoke discussion is as follows.

"Wealth must come to be regarded as imposing the responsibilities of a Divine stewardship, whose accumulation may not be stained with injustice, and whose use must obey the dictates of righteousness and intelligent philanthrophy.".....

"WE have had much to say about the neglected classes. We need to preach the law of God to the rich; to remind them that as men sow, so shall they reap, and that their own safety depends upon their justice and humanity. 'The neglected classes' live in palaces as well as hovels, and both are to be taught that the kingdom of God, man's true dignity and highest felicity, is not meat and drink, but righteousness, joy and peace in the Holy Ghost.".....

Such statements are timely and have a special significance.....

Domestic Economy

CONDUCTED BY MRS. AGNES E. M. CARMAN.

EXTRACTS FROM SUNDAY EVENING TALKS AT THE RURAL GROUNDS.

"COME unto me all ye that labor and are heavy laden and I will give you rest. Take my yoke upon you and learn of me, for I am meek and lowly in heart and ye shall find rest unto your souls For my yoke is easy and my burden is light."

* * *

To bring this home to our every-day lives who is there among us that is not given to fault-finding and which of us has not been discouraged and disheartened at times by being found fault with justly but not generously? Let us see how much of the burden of fault-finding Christ laid upon his followers. Take the example of Peter. Not a word of reproof, only one sorrowful look from the loved leader when Peter denied him. And after his resurrection the commands: "Feed my lambs;" "Feed my sheep"—a sacred trust given to him as the seal of his forgiveness.

Look at Paul's history: he persecuted the Christians with all the zeal of a Jew and a Roman combined. Was there a word of fault-finding when Jesus appeared to him on his way to Damascus? "Paul, Paul, why persecutest thou me? It is hard for thee to kick against the pricks." And Paul's cry "Lord what wilt thou have me to do?" "Arise and go into the city and it shall be told thee what thou must do." And when he reached the city it was to learn that he was a chosen vessel unto Christ to bear his name before the Gentiles and kings and before the children of Israel. Not a word of all his sins. But the true way shown to the truly penitent man.

This is the way we should treat one another. The command is "Bear ye one another's burdens and so fulfill the law of Christ." What burdens? All of them. What are our heaviest burdens. Our work? Our discomforts? No, our faults and deficiencies, and it is these that we criticise sharply in each other instead of remembering that they are part of the burdens we are to bear for each other. There is a generous, loving, hopeful, and helpful way to criticise, and by so doing truly bearing others burdens. But a constant critical supervision of each other does not lighten our burdens. How often I've thought of the sources from which I've received most help; they have been the suggestions and criticisms of those whom I knew had faith in me and believed I could improve. Others flung at me just and needed criticism, but I drew into a shell of indifference and discouragement under such influences.

It is Christ's assurance that he came to save us, that he loved us before we knew

When Baby was sick, we gave her Castoria,
When she was a Child, she cried for Castoria.
When she became Miss, she clung to Castoria
When she had Children, she gave them Castoria

him, that our sins, though they were as scarlet shall be like wool and shall be remembered no more forever. There is all of purity, goodness and love to be learned from Christ; but, leaving generalities and coming to some special thing in which we can obey the command: "Take my yoke upon you, and learn of me:" there is no better place to begin than right here in our criticisms of others, especially of those who are nearest and dearest to us. Unkind criticisms from my brothers and sisters are remembered long after the fault-finding of strangers has been forgotten, and I am painfully sure that I have many an unkind criticism to atone for by generous praise and kind advice. Thinking over all that you can recall of Bible history, is it not true that Christ's message to individuals was always hope and work for the future, never harsh reproofs for the past. The severe judgments are all passed upon classes of men—the Pharisees, for instance—and not upon one man singled out.

* * *

ONE of the members of our little circle brought up the question of sincerity at the last Sunday Evening Talk. She said that it had always been a question in her mind whether *true* sincerity really required one to state disagreeable personal truths to friends and acquaintances. *Did* friendship or kinship authorize uncomplimentary frankness? Shall criticism enter the family circle? Shall the members of a family sit in judgment one upon the other? In fact, shall the plain, unglossed truth *always* be spoken to relatives and friends? The topic brought out a deal of discussion. One member said that she thought that nine times out of 10, plain, personal truths were fatal to friendship for the very reason that the motive that prompted their utterance was usually other than that by wishing to be sincere. Another contended that absolute sincerity was the key-note of friendship; that he never said ought behind a person's back that he did not feel it to be his duty to say it to his face. Mrs. C. thought that often in a moment of irritation, temper or physical pain, we uttered sharp truths of our friends and she questioned the wisdom of repeating those pricks in cold blood

Miss B. thought it more just to go to the one to whom the unkind remarks were made and retract them. She said, further, that the lives of many children are made miserable because every one feels at liberty to tell them, flat-footed, of their failings and short-comings, and they are thankful indeed to arrive at an age when their faults are pointed out less freely by their acquaintances.

We should be glad to hear from our friends on this subject, and offer these columns for discussion in R. N.-Y. of January 25.

* * *

All matter for the Domestic Department should be addressed to River Edge, Bergen County, New Jersey.

POTATOES.

THE humblest vegetable that comes to the table is probably the potato, and it is the one we could least afford to banish. Being such a constant attendant at our tables, it must appear dressed in a variety of ways if it is to continue to please us. Well boiled in the brown jacket, which nature has given it, or baked in the same coat, it becomes a dish fit for an American. When the skin is removed, by seasoning it and adding to it cream to suit the taste, just as cream is poured over strawberries, the "earth apple," in the opinion of some, is never more delicious. To the objection made that this is extravagant, the answer is that more butter is generally used on potatoes cooked in this way than is in the cream that is used instead, and the work of making the butter is saved.

Mashed potatoes to be the best of their kind should be drained well when done, mashed perfectly, seasoned with salt and cream, and beaten vigorously, as if they were the whites of eggs, being whipped into a stiff froth, then placed in a hot oven to brown before they are eaten.

Cold, mashed potatoes when made into balls for frying are improved by adding a little milk and flour before making the balls or an egg and flour. Raw potatoes sliced thin, and boiled in a little water, then salted and peppered with the addition of a lump of butter melted in them, are good. This is a process that gives around the potatoes a dressing that is thickened by their own starch. The quantity of water over the potatoes to make this dressing will be much or little as the cook may prefer. Fried potatoes are under a ban, but some of us like to eat them occasionally at least. Raw potatoes sliced very thin and covered closely in a skillet containing a large spoonful of hot fat, come out soft and tender partly browned and with a flavor that cold potatoes fried crisp, do not have. They must be stirred occasionally while frying, and a hot fire is essential or they will be soaked in the fat and far from good.

Potato soup on a cold day is good eating. One method of making it is to cut the potatoes into chunks, boil them in water enough to make a good dishful of soup, and when the pieces are tender, thicken the soup with a-half-cupful of well-browned butter into which two table-spoonfuls of flour have been stirred after the butter began to brown. In seasoning the soup, remember that the salt in the butter has already seasoned it somewhat. Cubes of dry toast stirred in when the soup is served, complete the recipe.

Another good soup is made by thickening the boiling water with a little flour first mixed with enough cold water to make a thin smooth mixture and then dropping into the pot small dumplings made by stirring together two eggs, half a cup of milk, a little salt, a spoonful of baking powder and enough flour to make a thick, but not stiff batter; each spoonful dropped into the soup while it is boiling will make a dumpling and its size will be determined by the size of a spoonful; little dumplings are more quickly cooked through. This soup should be eaten as soon as the dumplings are done. It will take but a few minutes to cook them, so they should not be put in until the potatoes are tender.

Potatoes are too often spoiled in the cooking; because they are such a common article of food it seems unnecessary to take any pains in preparing them for the table. The commoner they are the more we prize them when unusually good.

There are several ways of dressing them in milk. One of the best is to slice raw potatoes very thin and put them in an earthen baking dish, cover them with milk and bake them. This takes longer than other methods, but the result is a very palatable dish of food.

Saratoga chips can be made in some quantity and put away for future use in paper bags. To prepare them for the table when needed, place them in a hot oven until heated through. A. E. B.

THE R. N.-Y.'S WAY OF BOILING POTATOES.

AGAIN we repeat the following directions: Select potatoes of the same size, peel, wash and pour over *boiling* water to cover. Cook until tender, but not so they will fall in pieces, drain off every particle of water, stand on the back of the stove, drawing the lid half an inch to one side to allow of the escape of steam. In a minute replace the lid, hold tightly in place and invert the sauce-pan once or twice. Again return to the fire, removing the lid as before, replace, invert again and turn into the dish in which they are served. This will give mealy potatoes, if there be any mealiness in them.

TO BAKE POTATOES AS WE LIKE THEM.

PARE and slice raw potatoes rather thin. Take of butter, or lard, or good fryings, one table-spoonful or just enough to keep the potatoes from sticking to the pan, and heat smoking-hot in an iron pan. Put the sliced potatoes in, adding salt, and bake in a *hot* oven until done, stirring occasionally.

To have them extra-nice, pare in fine parings instead of slicing them.

POTATO ROLLS.

BOIL two pounds of potatoes, pass through a colander, or mash them well; add two ounces of good, sweet lard, a pint of milk and a little salt, one gill of yeast, and as much flour as will make a soft dough. Set to rise. When light, roll and cut in round cakes one-half inch thick. Fold across and set in a warm place till very light; bake in a brisk oven. With good material, these rolls cannot be excelled. MRS. E. T. I.

SNOW POTATOES.

BOIL, pour off the water and steam off on the back of the stove, then rub through a colander into the dish you are to serve them in. Serve at once.

BROWNED POTATOES.

BEAT up mashed potatoes (liberally seasoned) until light, form into a round or oval shape, cover with the beaten whites of two eggs and brown in the oven. Slip carefully on to the dish that is to be sent to the table and serve.

POTATO PUFF.

TAKE three cups of cold mashed potatoes, add two table-spoonfuls of melted butter, a tea-cupful of thin cream or rich milk, salt and two beaten eggs. Beat together, put into a baking dish and bake in a quick oven until brown. Excellent tea dish.

POTATO CROQUETTES.

TAKE seasoned cold mashed potatoes, to each cupful add two table-spoonfuls of cream. Form into oval balls with floured hands, dip into a beaten egg then in cracker dust and fry in hot lard or drippings.

MRS. ECONOMY.

NEVER dish up boiled or baked potatoes and let them wait for other things.

POTATOES IN DIFFERENT WAYS.

DOES anybody want to know the variations played in our kitchen on the tune of plain, cold, boiled potatoes? Here they are: Milk is the key-note, and the first recipe is this: Put three-fourths cup of milk—with the cream on—in a shallow frying-pan; heat to boiling point, then add a pint of cold sliced potatoes, salt, pepper, and a generous lump of butter; simmer gently a few minutes, and serve *hot*. A second recipe is: one cup of milk to which, when it boils, is added a table-spoonful of corn-starch paste, then put in one pint of potatoes cut in dice, and the salt, pepper and butter needful. Or instead of corn-starch, stir in a well-beaten egg just before serving. The other variations are made by using the above ingredients and adding different flavors: as at one time sprays of fresh parsley: at another boiled corn cut from the cob: at another a sliced onion or two—though these last must be cooked in water awhile before being added to the potatoes. Still another way is to put bits of dried beef in the pan, add one-half cup of cold water, simmer awhile, then add potatoes, and seasoning needed. Yet one more is this: mince the cold potatoes; put in a baking dish; add salt, pepper, butter and one-half cup of milk, and bake half an hour in a moderate oven. Fried potatoes I say nothing about except that in my experience they have proven an indigestible mess, and therefore not to be tolerated in a cookery department where only wholesome food is prepared. BETTY.

MASON & HAMLIN

The Cabinet Organ was introduced in its present form by Mason & Hamlin in 1861. Other makers followed in the manufacture of these instruments, but the Mason & Hamlin Organs have always maintained their supremacy as the best in the world.

Mason & Hamlin offer, as demonstration of the unequalled excellence of their organs, the fact that at all of the great World's Exhibitions, since and including that of Paris, 1867, in competition with best makers, of all countries, they have invariably taken the highest honors. Illustrated **ORGANS** $22 to $900 catalogues free.

Mason & Hamlin do not hesitate to make the extraordinary claim for their Pianos, that they are superior to all others. They recognize the high excellence achieved by other leading makers in the art of piano building, but still claim superiority. This they attribute solely to the remarkable improvement introduced by them in the year 1882, and now known as the "MASON & HAMLIN PIANO STRINGER," by the use of which greatest possible purity and refinement of tone, together **PIANOS** with greatly increased capacity GRAND & UPRIGHT. for standing in tune and other important advantages.

A circular, containing testimonials from three hundred purchasers, musicians, and tuners, sent, together with descriptive catalogue, to any applicant.

Pianos and Organs sold for cash or easy payments; also rented.

News of the Week.

HOME NEWS.

SATURDAY, December 14, 1889.

FOR the first 10 months of the current year the number of immigrants arriving in this country was 378,141, showing a falling off of 95,032 as compared with the arrivals in the first 10 months of last year. Of late years Australia, the Argentine Republic and the various African colonies have been attracting more and more emigrants from Europe.....The actual amount of the Silcott defalcation is put at various figures: but it is no doubt under $100,000. He took $71,800 belonging to Congressmen, the sums due to 36 victims ranging from $200 to $4,800. It is more than doubtful whether the Sergeant-at-Arms is legally responsible to Congressmen for their losses, and should a bill be introduced to reimburse them from the National Treasury it is likely to meet with a strong opposition. Their losses are said to be due to their own carelessness in not drawing their pay when due and a general shiftlessness in signing for it. Silcott forged the names of many, and forgery is an extraditable offence. His present whereabouts is unknown, but the detectives are after him..... Another trade conspiracy is likely to follow the example of the Cotton-seed Oil Trust by seeking incorporation and acting openly. Eight companies belonging to the jute bagging combination, with a total capacityof 31,300,000 yards will be incorporated under the laws of West Virginia with a capital stock of $1,000,000 containing very little "water." Fourteen mills with a capacity of 30,600,000 yards will remain independent. With an over-production of jute bagging, and a growing competition from cotton bagging, prices of jute bagging, unsustained by a cabal, are likely to have a big tumble soon.....Mrs. Scott Lord, the sister of Mrs. Harrison, died at Washington last Tuesday. This will wet-blanket festivities at the White House for some time.....The Globe refining Company of Pittsburg, about the largest independent oil-refining company in the country, with a capacity of 20,000 barrels a week, storage room for over 100,000 barrels and 370 oil cars, has been bought by the Standard Oil Trust for $4,000,000. It was negotiating to lay an opposition pipe line from the oil territory to the seaboard at a cost of $3,000,000; but the Standard has once more got rid of a formidable competitor..... The funeral services of Jefferson Davis last Wednesday attracted to New Orleans the largest concourse of people that ever gathered in the Crescent City. Everything was done that could show honor to the dead and affection for him. Memorial services were also held in every city and town throughout the South. He died $40,000 in debt, but he owned a tract of 6,000 acres in Arkansas, besides his Mississippi homestead and some other property. A fund of at least $100,000 is being raised for his family throughout the South, and as Mrs. Davis objects to charitable contributions, a company has been formed to purchase the Arkansas tract at a good figure. Probably a good deal more than $100,000 will be raised.....Last Tuesday night during the performance of "Uncle Tom's Cabin" at the Opera House at Johnstown, Pa., a cry of "Fire!" was raised and in the mad stampede to escape 12 of the audience were crushed to death and 75 more or less severely injured.....Oliver Johnson, the veteran abolitionist and journalist, died in Brooklyn, Tuesday..... Throughout Kansas there is a car famine due chiefly to the enormous crops that have to be moved to the market and partly to the enforcement of the new grain inspection law and the fact that the railroads, not having anticipated such an enormous business, had not made adequate preparations for it.....

FOREIGN NEWS.

SATURDAY, December 14, 1889.

An antarctic exploration committee has been organized in Melbourne, the chief city of the colony of Victoria, Australia, and the most important city in the continental island, with a population of 250,000..... Next week Gladstone will be 80..... Boulanger has made a contract to lecture in the United States. He speaks English first-rate, his mother having been English and he having spent several years of his boyhood in an English school.....Oscar Searle, champion oarsman of Australia and the world, died the other day..... ..... The epidemic of influenza or "grippe" has spread from St. Petersburg to Stockholm, Berlin, Vienna, Paris and a large number of other important towns and cities in Europe. It is likely that the entire continent with all the adjacent islands, will soon be violently coughing and sneezing. .....The latest advices from Brazil indicate that the revolution in the country was brought about by the action of an insubordinate colonel who quarreled with the Minister of Marine over an order which he considered unjust, and shot the Minister down, whereupon the "regular" troops, disgruntled at the prospect of losing their dominant influence through the organization of the militia, mutinied. The "Imperialists" appear to have been dumbfounded at first; but have since been agitating in favor of the restoration of imperialism, and the Republic seems hardly well established as yet. There have been several bloody encounters between the troops and the people, but as all the telegraphic and postal facilities are in control of the new Republican government unfavorable news is not permitted to go abroad. The late Empress's diamonds, among the most valuable in the world, were per force left behind at Rio when the Imperial family were ordered away at an hour's notice, and they have since been stolen. If Dom Pedro refuses the income offered by the Republic or if the latter should discontinue it, the loss would be a serious blow, as the sale of the diamonds would have been the main dependence of the family in such a contingency.....

No. 279 Washington St., New York City

AGRICULTURAL NEWS.

SATURDAY, December 14, 1889.

THE Senate committee to investigate the dressed beef business, whose investigations at Chicago and Kansas City the past summer were reported in the R. N.-Y. at the time, has resumed its investigations in Washington. Mr. H. Hoover, a Washington butcher, testified that he was told last spring that it would not be wise for him to bid on Government contracts, for if he or any of his friends got any of those contracts the Chicago beef men would not sell him any meat and would drive him out of the market. He did, however, secure some small contracts, when these threats were carried into effect. None of the agents of Armour & Co., Swift & Co., and Nelson Morris would sell meat to him or to his friends who tried to purchase for him. Complaint was made to the Chicago houses direct through an attorney. Armour & Co., and Nelson Morris answered saying that they did not countenance any such proceeding. In order to test the matter, the witness took a friend and tried to buy meat of the agents of these firms, but could not do so at the market rates. They asked him two or three times the regular rates and have not since sold him any meat. A salesman for Nelson Morris said that Mr. Hoover's statement was true, and

GET YOUR SUPPLY FROM HEADQUARTERS OF THE NEW AMERICAN SEEDLING POTATO,

We Will Give a Year's Subscription Free to the

NEW YORK LEDGER

to every reader of this advertisement who will cut out of any paper in the United States, and send to the address below, the advertisement of any illustrated paper or magazine containing so much high-class matter for so little money as the following advertisement of the New York Ledger for 1890 announces:

INSECT PESTS. Prof. J. H. Comstock, of Cornell University, will contribute a series of six useful papers on the study of insects. Prof. Comstock treats of bugs that are useful to the agriculturist, as well as those that are destructive. He points out in the clearest scientific way how to destroy the pests of our grain, rice and cotton fields, of our orchards, our gardens, and our vineyards. His articles are of inestimable value.

STRANGE TIDINGS FROM UNFREQUENTED LANDS. A series of eight articles by Herbert Ward, the companion of Stanley in Africa. These articles will cover five years' adventures in Africa, and they will be illustrated by sketches made by Mr. Ward on the spot, and by photographs taken by him in Africa. These pictures will throw much light upon the manner and customs of the hitherto unknown cannibal tribes of Africa.——Rev. E. R. Young, the celebrated missionary, will furnish fifteen articles on the experiences and adventures of himself and his wife during twenty years' residence in British America, twelve hundred miles north of St. Paul.——Leo Hartmann, Nihilist, writes twelve sketches showing how the intelligent people of Russia are becoming Nihilists in consequence of the despotism of the Russian form of government.

ILLUSTRATED SOUVENIRS. SENT FREE TO ALL SUBSCRIBERS. The first of these souvenir supplements will be a Poem by John G. Whittier, illustrated by Howard Pyle, and engraved by H. Wolf, R. G. Tietze and E. A. Clement. The next souvenir will be a beautifully illustrated poem by James Russell Lowell.

SERIAL STORIES BEAUTIFULLY ILLUSTRATED. Continued stories will be contributed by such wholesome and captivating authors as Frances Hodgson Burnett, Anna Katharine Green, Elizabeth Stuart Phelps, Robert Louis Stevenson, Col. Thomas W. Knox, Albion W. Tourgee, Prof. W. C. Kitchin, Robert Grant, Frank H. Converse, Harold Frederic, and others.

CONTINUED ARTICLES. These articles were written especially for the "Ledger" by writers whose reputation and capability establish them as the persons most eminently fitted to treat that particular subject assigned to each.——The Hon. George Bancroft contributes three articles on The Battle of Lake Erie, beautifully illustrated.——Hon. Henry W. Grady furnishes six articles on The Wonderful Development of the New South.——James Parton contributes a series of articles on Incidents in the Life of Andrew Jackson.——Rev. John R. Paxton, D. D. contributes six articles on Experience in My Army Life.

POPULAR INFORMATION. Throughout the year the "Ledger" will contain hundreds of sketches of popular information which will supply an amount of beneficial information that will be of inestimable value to those who are in search of something instructive and useful.——Prof. Alexander M. Stevens will explain the manners and customs of the Moki Pueblos, a peculiarly strange tribe of Arizona Indians.——Dr. Felix L. Oswald is, by special arrangement, contributing a series of popular scientific sketches, embracing the observations of the writer during his investigations into the unfamiliar phenomena of natural history and occult science.——C. F. Holder contributes an extended series of articles on singular aspects of animal life on sea and land. His articles are brimful of information.

SHORT STORIES COMPLETE IN EACH NUMBER. Hundreds of illustrated short stories will be given during the year from the pens of such familiar and fascinating authors as Madeleine Vinton Dahlgren, Col. Thomas W. Knox, The Marquise Lanza, Margaret Deland, Julian Hawthorne, Harold Frederic, Harriet Prescott Spofford, Clara Whitridge, George F. Parsons, Marion Harland, Mary Kyle Dallas, Amy Randolph.

IMPRESSIVE PAPERS. These papers are a medium through which the readers of the "Ledger" will be entertained by many of the most eminent men of the day. The benefit derived from these articles will in itself compensate any one for the price of the "Ledger."——Murat Halstead contributes a series of papers on The Journeyings of a Journalist, being the experience of the author during his travels Around the Globe.——Rev. Dr. McCosh, ex-President of Princeton College, furnishes a series of papers on the present state of religious thought and development, entitled On the Border Land of Religion.——Hon. George Bancroft tells of A Day Spent With Lord Byron.——Prof. Eliot Blauvelt explains how Egypt fell into a state of ruinous distraction, consequent on the decline of the Roman government, and how every species of barbaric rudeness superseded the refined habits of the people.——Rev. Dr. Henry M. Field contributes a paper on The Lopez Expedition, the first of a series of articles descriptive of thrilling historical episodes.——Many other highly impressive papers are in preparation by M. W. Hazeltine, E. L. Godkin, Rev. Dr. John Hall, James Parton, Prof. W. C. Kitchin, Rev. Emory J. Haynes, and George Frederic Parsons.

HOUSEHOLD ARTICLES. Six articles will be contributed by Miss Parloa on American Cookery, explaining why it is imperfect, and giving some ways by which it may be improved and economy practiced.——Dr. Julia Holmes Smith will write a series of articles on Common Sense in the Nursery, offering valuable suggestions concerning the care of children.

OTHER FEATURES. The "Ledger" will also contain Historical and Biographical sketches, Poems, Ballads, Travels, Adventures, Science Items, Answers to Correspondence, and a vast quantity of matter interesting to the household.

ROBERT BONNER'S SONS, 129 William St., New York.

that he had instructions to sell to him at two or three cents above the market rates. No reason was given for this, and the instructions were not now in force. John N. Hoover, a brother of the former witness, confirmed his testimony, and said that the boycott was lifted while the Senate committee was making its investigations in the West, and that any of the firms would sell him meat now. Another butcher confirmed the testimony of these witnesses. The committee think of visiting New York to investigate the dressed-beef export trade.....

A consignment of 3,479 tons of Java sugar was recently made to a Boston firm who are not members of the trust.....

The December cotton report of the Department of Agriculture says that the crop matured late, and that early frosts reduced the yield somewhat, especially in the Northern belt. Prices are a little better than last year.....The New York State Dairymen's Association in session at Ithaca elected the following officers for the ensuing year: President, W. H. Gilbert, of Richland; vice-president, J. W. Edmonds, of Sherman; secretary, Hon. Josiah Shull, of Ilion; treasurer, G. E. Powell, of Ghent; directors—Jesse Owen, of Elmira; General Edward F. Jones, of Binghamton; Hiram Olmstead, of Walton; Dudley Miller, of Oswego; Frank Blonding, of Hubbardsville, and E. F. Ladd, of Geneva.....

The Delaware State Grange has been in session at Dover. The meeting was largely attended, and the reports showed the organization in a prosperous condition.....

The Connecticut Board of Agriculture will meet at Birmingham, December 17-19. An excellent programme is presented, and an opportunity will be given for discussion of each paper. There will be music, a question box, an exhibition of fruits and other farm products, etc. T. S. Gold, Secretary.

....The Michigan Short-horn Cattle Breeders' Association will hold its ninth annual meeting in the senate chamber at Lansing, December 18 and 19. I. H. Butterfield, secretary, La Peer.....The New Jersey State Horticultural Society meets at Trenton, December 18-19. E. Williams, Montclair, secretary.....The United States consuls throughout Canada have been instructed by the Department of Agriculture to furnish it monthly reports of the area, condition and quality of crops in their districts, together with all particulars of interest to farmers which it is possible to gather. It will not be possible to do much before another year.....

Crops & Markets.

SATURDAY, December 14, 1889.

To summarize the potato situation, there have been heavy crops in most of the Western States, and prices have been low; in all the Eastern States except Maine, which had a very heavy yield, the tubers have rotted badly, lessening the yield materially and those escaping are many of them of poor quality. The result is heavy shipments from the West which have kept the market well supplied; while prices have been low in the West, heavy freight charges prevent a very high net price to the distant shipper. Still there have been heavy shipments of Western potatoes. One dealer said he had received potatoes on which the freight charges were $250 per car-load. W. E. Duryea's Sons are heavy importers of foreign potatoes, but they inform us that their importations have been light thus far on account of the large receipts of Western stock. Freight rates favor the Scotch potatoes, as they can be brought from Dundee cheaper than they can from neighboring States. The rate now is 27 cents per sack of 168 pounds. It sometimes advances to 50 or 60 cents. At the lower freight rates which usually prevail, even with the 15 cents per bushel duty added, it is easy to see that potatoes from the interior have a strong competitor in the imported tubers. The variety imported from Scotland is Magnum Bonum. Potatoes are also sent here from Germany, England, Holland, New Brunswick, Nova Scotia, and other countries. The crop in most if not all of these countries is reported heavy, and shippers are only awaiting a cessation of Western shipments to send on large quantities. The reason of such cheap freight rates is that vessels have little freight and will bring over potatoes for about what it costs to load and unload them; they make very good ballast. Magnum Bonums sell now for about $1.80 to $2 per sack. Domestic potatoes are in good demand if of good quality. Burbanks are more in demand than they were, but the variety makes little difference. Smooth, clean, well-assorted tubers of good quality are what are wanted. Under existing conditions, prices are likely to be moderately high, and the supply ample.

58 Liberty Street. New York.

I CURE FITS!
When I say cure I do not mean merely to stop them for a time and then have them return again. I mean a radical cure. I have made the disease of FITS, EPILEPSY or FALLING SICKNESS a life-long study. I warrant my remedy to cure the worst cases. Because others have failed is no reason for not now receiving a cure. Send at once for a treatise and a Free Bottle of my infallible remedy. Give Express and Post Office.
H. G. ROOT, M. C., 183 Pearl St, New York.

Literary.

MAGAZINE REVIEWS.

BELFORD'S MAGAZINE contains an editors' symposium on "The World's Fair," meaning the proposed memorial celebration commemorative of Christopher Columbus's great discovery. The contributors are Col. Cockrill, New York World; Crosby S. Noyes, Washington Star; Charles Emory Smith, Philadelphia Press; Frank Hatton, Washington Post; Alexander Wilder, late of the New York Post; Thomas B. Bryan of Chicago and James S. Redpath, late of the North American Review, also of New York. As might naturally be expected, each writer favors its location in his own city. The symposium to have been complete, should have represented St. Louis which is a claimant for the honor (?) by no means to be despised. The bulk of evidence is in favor of New York which also presents the strongest arguments. The only disinterested writer is Mr. Smith. Of course, Philadelphia cannot expect any one to favor that city as a site, so he is untrammeled by selfish interests. He favors New York, and, in our estimation, makes the soundest argument of any of the contributors. Helen W. Pierson contributes "Keturah's Little Scheme," a very romantic story of a mining camp. "Old Scribe" gives a reminiscence of "Little Patti" the now famous primadonna. He describes her "as a tall, gaunt girl" who was led into his studio for the purpose of having a drawing made of her, in 1846, but as her birth is recorded in 1843 there is evidently a discrepancy somewhere. H. K. Thurber gives a short article on "Our Commercial Marine" which should be read by every American citizen. It is well known that the shipping of the United States has been rapidly decreasing, but the cause is not so well known. In 1869, of our exports and imports 66 per cent. were freighted in American and 34 per cent. in foreign vessels; in 1889, 14 per cent. were freighted in American and 86 per cent. in foreign vessels. Mr. Thurber attributes this, not to the tariff laws, but to the policy of the government which has not "protected" and encouraged the commercial marine. "Looking Forward" is a satirical sketch of 1976, intended to represent the country in the last agonies of protective fever. Felix L. Oswald, M. D., contributes a very interesting and instructive article on "Cats." There are several other contributions which space forbids our noticing, and a complete novel: "Atahualpa's Curtain," by John Dimitry. Belford Company, New York.

THE HOME-MAKER for this month is emphatically a Christmas number, most of the articles having special reference to this holiday. The frontispiece is a droll sketch by F. S. Church, entitled "Christmas All Around the World." "Aunt Polly's Christmas" is a touching sketch of an old negress who was "bawn in de family," and always "b'longed to de Hendersons," and who in her old age and helplessness was about to be sent to the poor-house. The old owners were all thought dead, and the place and the cabin where she had been permitted to remain so long, had been sold, and there was no other place for her to go. But the long-lost son of the family returned, and Aunt Polly passed her remaining days in the old cabin. "An African Christmas Story" by Barton Lee, and "Bea's Whim" by Sophie May are excellent Christmas stories for the young people. Anna Alexander Cameron gives an excellent word-picture of "Christmas on the Old Plantation." "The Evidence of the Negative" is an Arkansas narrative suggestive of a very tragic termination, but happily ending in a manner entirely different. There is a long list of "Holiday Recipes" from "Southern Kitchens" which are very suggestive of Christmas feasting. There are numerous directions for making Christmas gifts, which, considering the paucity of such instructions at this season, cannot but prove very acceptable. "Common Sense Temperance Talk with our Girls" should be read by every young woman in the land. There are numerous illustrations, but they are so decidedly inferior as to suggest the work of amateurs instead of artists. Only two or three are passable. Old readers of the Home-Maker will be saddened to learn of the death of Catherine Owen, (Mrs. Helen Nitsch) who has been a regular contributor since its first issue. A beautiful tribute is paid to her memory by the editors. The Home-Maker Company, New York.

THE WRITER has a chapter of "'Don'ts' for Young Writers," which are of equal value to older writers. From among the many valuable ones, we select a few. "Don't punctuate your manuscript with dashes in place of commas, semi-colons and periods." "If you don't know how to use commas, semi-colons and periods correctly, learn." "Don't send directions that such and such words of your copy must be italicized. Every publication has its own standard of taste about such matters, and it will probably adhere to it." Many valuable hints are given under "Needless Words." An exceedingly helpful department, "The Use and Misuse of Words," has been added. There is much that will benefit literary aspirants in its pages. The Writer, Boston.

Law.

"Every Man is presumed to know the Law. Nine-tenths of all Litigation arises from Ignorance of Law."

WHY ONE SHOULD MAKE A WILL.

L. T., Dutchess County, N. Y.—If a person who owns a valuable farm and considerable personal property, desires to make an equal provision for his wife and children, is there any particular necessity or advantage in a will? In other words, what disposition is made by the laws of this State of the estate of a man who has left no will?

ANS.—If a man dies intestate in this State leaving no children, his widow has a dower right to his real estate, and one-third of his personal property. The fee of the real estate and two-thirds of the personal property are divided equally among the children or their descendants who take the dead parent's share. There are many advantages in a will, however. It appoints an executor, whereas if the widow becomes administrator she must give bonds in twice the amount of the personal estate, and might find it difficult to obtain a bondsman. If duly drawn, the will gives the widow (if she is named executrix) the right, in case of necessity, to dispose of the real estate; whereas, if the children are minors, it is difficult to effect this. It is sometimes advisable to join a disinterested person with the widow as executor, to protect the interests of the children in case she should marry again.

WIFE SIGNING A MORTGAGE ON REAL ESTATE.

T. M. S., Seneca County, N. Y.—1. A owns a farm on which he wishes to borrow money on a mortgage. His wife is strongly opposed to the plan. Is her signature necessary to the mortgage? 2. Should a deed to real estate be in the joint names of man and wife?

ANS.—1. A wife has a dower interest in the real estate of her husband. This is a life interest in one-third of what remains of it after all the encumbrances and liens against it have been paid. This interest is ordinarily good against any one claiming under a deed or mortgage which she has not signed. In this State, however, and in several others, if a husband executes a mortgage to secure a part of the purchase money to be paid for the land, the widow will not be entitled to dower out of such land as against the mortgagor or those claiming under him, even though she has not united in the mortgage. The wife must be of age when she joins her husband in a conveyance of land in order to bar her dower or right of dower. 2. There is no advantage in having a deed to real estate made to both husband and wife.

SATISFACTION PIECE.

T. M. R., Schuyler County, N. Y.—Is the holder of a mortgage obliged by law to give a satisfaction piece when the mortgage is paid in full? If so, who pays the expense of drawing up the satisfaction piece?

ANS.—A creditor is not bound to give a receipt for money paid, and this principle is held to cover even a mortgage debt. If the mortgagor wishes to have a satisfaction piece signed, he must prepare it and present it to the mortgagor for his signature. Even then there is no summary process by which the latter can be compelled to sign it. If he refuses to do so the mortgagor's only remedy is to pay the debt in the presence of witnesses and then bring an action to cancel the mortgage of record and compel the execution of a satisfaction piece.

T. L., Herkimer County, N. Y.—A and B jointly own a mortgaged farm. When the mortgage falls due A proposes to assume it, charging the joint property with interest as before. Should A and B make out a mortgage to it, or can A be protected to the amount of the mortgage as against possible creditors of B?

ANS.—One who has bought a part of any premises subject to a mortgage can have the mortgage assigned to him and it will be as valid in his hands as in those of the original holder. Accordingly in the case under consideration, the simplest plan would be for A to pay the mortgage debt and take an assignment of the mortgage to himself.

A JERSEYMAN'S JOTTINGS.

"REPORT OF THE SOCIETY FOR THE PROMOTION OF AGRICULTURAL SCIENCE."

THE R. N.-Y. sends me a pamphlet bearing the above title and asks me to review it from the standpoint of a practical farmer! I am nothing of a scientist myself; life is a very practical thing with me, a matter of the hardest kind of dollars and cents. If the R. N.-Y. wants to know what I think about the pleasant little talks made by these scientific gentlemen, and how far I consider them valuable to me in my farm work, all very well. As for any scientific review of the matter—that is far beyond me. The meeting under discussion took place at Toronto, Canada last August. I will give the topics as they appear in the report. First let me say that I do not know that these gentlemen claim to talk so that farmers can readily comprehend them. These talks are for their own benefit—they are to be translated into the farmer's language later.

What Is Common Wheat Rust.—I do not raise wheat now and therefore do not feel much interest in this topic. After reading what Prof. Arthur has to say, I know just as much as I did before about it, certainly not any more.

Notes on Bird's-Eye Maple.—Dr. Beal gives an interesting talk on this subject. There is nothing in it that can help us to make more money at farming, but it will teach one to be a little more observing while in the woods. Dr. Beal also tells about some acorns that were buried for four years. I cannot see much point to this experiment.

The Grass Problem in Nebraska.—If I lived in Nebraska I should consider this article by Dr. Bessey a valuable and helpful one. As I live in New Jersey where we must raise the grasses that the hay men think most of, it won't do me any good.

A Bacterial Disease of Indian Corn.—Prof. T. J. Burrell tells about a new disease which attacks corn and sorghum out West. To judge from his descriptions we have never had it here. "We know too little of the disease to suggest a remedy," he says.

Arsenical Poisons as Insecticides.—Prof. A. J. Cook is a practical scientist. He has a farm of his own in which he can sink his surplus money and it may be that this sort of burial has had a good effect on him. I find that the coddling moths do about as much damage to the apples as the beetles do to the potatoes, and from a few experiments I have tried I am convinced that Paris-green will prove as effective against one insect as against the other. The average farmer has almost too much work to do at the time for spraying, and if we are to have any more seasons like the last, the poisons will will wash off faster than we can put them on. Prof. Cook thinks tobacco dust is going to kill the flea-beetle. He will find that the specimens of this insect we find in New Jersey will grow fat on tobacco.

The Nitrogen Supply of Maize.—I am always a little prejudiced against those experiments that are carried on in flower pots. There is too much multiplying about the result—too many "ifs." They are doubtless valuable as data upon which to build other and larger experiments, but that is as far as they go. I can't see anything about the result of the one recorded here that any observing farmer could not have told before the thing began.

Cranberry Gall Fungus.—Dr. Halstead has found a disease that threatens our cranberry plants. This disease dwarfs the plant and turns it red, preventing the formation of flower or fruit. Nobody knows how dangerous it is and nobody seems to know of any remedy. The cranberry crop is an important one with us and we would like to know more about this matter. Dr. Halstead has made out what he calls a "Scale of Points for Weeds." The "scale of points" we generally recognize here is about as follows:

Power of injuring farming,	100
All other qualities,	0
Total	100

However, Dr. Halstead's scale is interesting. The worst weeds I have are ragweed, burdock, Quack Grass and plantain. I see that farmers in other States report trouble from these fellows. They rank high in Dr. H.'s "scale of points."

Notes on Some feeding Stuffs.—Dr Kedzie finds that some grasses found in swamps analyze fairly well and ought to make cow food. The trouble is that such grasses are mixed up with harsh, coarse varieties which are too tough for stock to eat. They are almost too tough to use for bedding. Dr. K. finds that wheat screenings are excellent for stock food. For the price at which they are sold they are cheaper than bran or middlings. I am certain that this idea is correct.

Abnormal Production of Milk.—Prof. J. A. Myers tells of a heifer that produces five quarts of milk per day and has never had a calf. The heifer ran in pasture with a steer which began sucking her and kept up. When the steer was taken away it was found that the heifer gave milk. I have heard of one or two cases of this kind. Most farmers object to milking such heifers before they calve, but I never could see any objection to it. Prof. Myers's point is that handling and rubbing the heifer's udder may help develop it and induce a heavier yield of milk. I do not much believe in this. This "developing" business does not amount to much. To start the heifer off with a very large yield will be as apt to hurt her as to help her.

The Food Value of Sorghum Seed.—Prof. Wiley figures from his analyses that sorghum seed is fully equal, as a food for man and other animals, to corn and oats and is but little inferior to wheat. It seems to be more like wheat than corn in its composition. A great deal of money has been spent in New Jersey trying to make sorghum sugar at a profit. We have made some sugar but it has cost more than it was worth. Some of our wise men want us to grow sorghum instead of corn. We are told that we shall be able to get our sugar free, that the bagasse will be equal to corn-fodder, while the grain will equal corn for feeding. My stock do not seem to like sorgum seed. The hens will leave it until they are starved into eating it. Dr. Wiley also has a long article on some experiments made to see if the butter made from cows fed on cotton-seed was harder and less easy to melt than when no cotton-seed was fed. I do not see that there is much value to this article—certainly there is nothing proved.

Do Potash Fertilizers Prevent Blight?—After the season that has just passed we are all anxious to learn what we can about potato blight. It seems that last year Prof. Scovell noticed that the blight was least severe where a good supply of potash was used in the fertilizer; so he decided to try an experiment this year of planting different plats with different sorts of fertilizers using a good deal of potash on some of the plots to see if it would prevent the blight. The results prove little or nothing. My own idea about the matter is that a complete fertilizer is the best thing for any plant disease, unless you know that some one element is lacking in the soil. The idea of applying potash to soil that may already have potash enough is not very sound. No blight will be stopped that way.

Preventing the Potato Rot.—Here is another subject that we are much interested in. Prof. Weed's plan of spraying the potato vines with the Bordeaux Mixture has already been discussed in the R. N.-Y. I do not much believe it is practical on a large scale, still I have never tried it. Next year I mean to experiment a little. Something must be done or what with bugs, beetles and blight potato-growing in New Jersey is doomed.

There are a number of other things in the report that I do not feel much interest in. These scientists must have had a first-rate time, but unless the agricultural papers take up their essays and put them into simpler form the common farmers of the country will never be much wiser.

JERSEYMAN.

CATALOGUES, ETC., RECEIVED.

LIMITING OF FORTUNES. The R. N.-Y. has received a note from what purports to be "The United Service Club" of Washington, D. C. The object of this club is "to curb covetousness," by limiting the aggregate property in any form of individual ownership, to some fixed and reasonable sum, condemning the surplus as a public nuisance and a public peril. To bring about this desired result, the following amendment to the United States Constitution is proposed:

"No citizen or resident or investor in any or all States, Territories or Districts, comprising the United States, shall be permitted to possess, in all kinds of property, an aggregate value of more than Ten Millions of dollars; which sum shall be the limit of private property in any individual, joint-individual, guardian, trustee, or other form or device of private estate ownership. And whenever and wherever such private ownership or holding shall be found to exceed the limit above named, the surplus shall all be condemned as a public nuisance and a public peril, and be accordingly confiscated into the United States Treasury; from which it shall be from time to time, apportioned among all the State Treasuries. And the States, etc., shall, each and all, enforce this Amendment by necessary or penal legislation: failing which, Congress shall so enforce it."

Why make the sum so small? Too many of us are in danger of collecting the small sum of $10,000,000!

A BUSINESS EDUCATION.—Circulars from Bryant & Stratton Business College, Buffalo, N. Y. A course at this college will be of service to anybody who ever expects to handle any money. Who is not included under this classification?

RICE AND ITS BY-PRODUCTS.—Bulletin from the Louisiana Experiment Station. This is an interesting pamphlet, particularly so to the farmers in the Gulf States, who find rice a very important crop. It serves to feed the hired help on the Southern plantations as cheaply as any other product of the soil. Farmers in sections of the country where rice cannot be grown will be most interested in what is said about the by-products of the crop. These products are rice-bran, rice-polish, rice-straw, rice-hulls and rice-hull ashes. They are mainly valuable as cattle foods. While their production is necessarily limited, analyses show them to be so valuable, as compared with other foods, that a few enterprising feeders might strike a real bonanza by securing all they can of these rice by-products before the general public can discover their real value. In 1880 the total product of rice in this country was 110,131,373 pounds. It was all grown in eight States. It will thus be seen that the total amount of the by-products cannot be very great, still the few enterprising men who are willing to experiment with these foods and learn their true value, will, in the R. N.-Y.'s opinion, be well repaid. Rice-bran, about the only one of the products, as rice-polish is a small part of the total grain worth considering, sells in New Orleans at $6 to $7 per ton. The following analyses show the value of these rice products as compared with others better known.

	WATER.	ASH.	FATS.	FIBER.	PROTEIN.	CARBO-HYDRATES.
Rice-bran	10.67	11.10	9.97	10.95	11.29	46 02
Rice-polish	10.63	5 45	7.02	2.62	10.94	63 34
Wheat-bran	12.08	5 84	3 67	8.55	14 82	55 04
Rye-bran	12.30	3.62	2.19	3 51	15.25	63 12

It will be seen from the above that rice-bran is particularly rich in fats. It is well suited for use in a butter ration when fed with clover hay. In fact, the bran is better suited to feed with the best of fodders and will not answer to feed with poor fodders like straw or inferior hay.

HUDSON'S BICYCLE CULTIVATOR.—Circular from S. Terry Hudson, Riverhead, L. I., N. Y. The best way for us to call the attention of our readers to this implement is to refer them to the picture shown at Fig. 303, (page 836). This is taken from life and represents an energetic young woman starting for the field to cultivate the potatoes. She will do the work in good shape and without injury or loss of dignity to herself. The implement is highly indorsed by T. B. Terry and other observing farmers. We give its picture a place in this issue because it serves to illustrate how useful and enterprising the ladies of the R. N.-Y. family have become. The fact of the matter is, that with a sulky plow, an Acme or Cutaway harrow, an Aspinwall potato planter, Breed's Universal weeder, Hudson's Bicycle cultivator and Aspinwall potato digger a woman could successfully grow many hundreds of bushels of potatoes. The beauty of this cultivator is that it can be used in any crop. Send for the circular.

VOL. XLVIII. NO. 2083. NEW YORK, DECEMBER 28, 1889. PRICE, FIVE CENTS. $2.00 PER YEAR.

Entered According to Act of Congress in the Year 1889, by the Rural New-Yorker, in the Office of the Librarian of Congress, at Washington, D. C.

Biographical.

FIVE REPRESENTATIVE ILLINOIS FARMERS.

I DOUBT whether the RURAL NEW-YORKER could find among all of its subscribers five men more fairly representative of the practical, successful farmer than those whose portraits are given at Figure 306. They are not Lincolns, Gladstones or Bismarcks, but plain, every-day men, and excellent examples for our farmer boys. They didn't put on kid gloves and chokers when they were young, and strut about with a cane looking for a nice, soft, job, or loll about street-corners and saloons waiting for something to turn up, but they bravely and cheerfully went to *work* and turned something up. They worked hard for their money, and when they got it they *saved* it. They made mistakes, as does everybody, and they wisely profited by them. They know what it is to be hungry, cold and weary, and they have seen times when fate and the hand of every man seemed to be against them, but they had the grit to fight it out and of course they won the battle. They now have comfortable homes and are honored by their neighbors and acquaintances. They can attend fairs, exhibitions, institutes, and take summer outings without feeling the expense. In short, they have, by their own efforts, worked themselves up to a position where they can thoroughly enjoy all of the real comforts and blessings of life. Such men as these are truly the bone and sinew of our land, and ever will be the main-stay and support of this, the grandest government on the face of the earth.

No. 1 is Mr. M. Colbrook. He was born and reared in Germany. His father was a farmer. On arriving in this country he began working by the month for farmers. He entered the Union army and with the rest of his company was surprised and captured before Atlanta, and sent to Andersonville prison, where he remained three months. What he suffered there may be judged from the fact that he weighed over 170 pounds when he went in, and only 87 when he was released. For two years thereafter he hovered between life and death, but a sturdy constitution finally triumphed and he now tips the beam at about 200 pounds. As soon as his strength returned he began working for farmers again and investing his earnings in sheep, which were pastured on the prairies. Wool brought big prices and by careful and economical management he soon accumulated a large flock. Then he bought a quarter-section of prairie, half of which he broke and sowed to wheat. This yielded a good crop and proved a veritable boon, for soon afterward he lost almost his entire flock of sheep by disease contracted from a passing flock, and aggravated by a remarkably cold, wet season. This nearly bankrupted him, but he stuck to his land and by hard work and the closest economy held it until another good crop set him on his feet again. From that time on his progress has been unchecked, and he is now worth upwards of $25,000. One of his best strokes in farming was sowing all of his new land to winter wheat: his most disastrous, was trying to raise sheep without suitable shelter and conveniences. He advocates mixed farming to a certain extent, believing it the safest, but devotes his attention chiefly to growing corn and raising hogs. In breeding and fattening hogs for market he has been remarkably successful. His practice is to have pigs dropped moderately early, pasture them with enough corn to keep them growing lively through the summer, give them warm beds and all they will eat in the autumn, and sell them as soon as they are good, smooth light weights, such as always bring top prices in the Chicago markets. From wheat, corn and hogs most of his wealth has come. He is, as any one would infer from his appaarance, a jolly, good-natured fellow, shrewd, careful, economical, and as steady as a clock, and is highly respected by all who know him.

No. 2 is Mr. H. Grundy. He was born in England and emigrated to this country when 14 years of age, going direct to Illinois. He worked for farmers seven years, saving enough of his earnings in that time to enable him to begin farming for himself on rented land. Three years afterwards he bought 160 acres of raw prairie and succeeded by hard work and the closest economy in paying for it within five years. From that time to the present his rise has been steady, and he is now worth over $20,000. He believes in mixed farming, and follows it with such skill that he makes money out of everything he handles. His great success is wholly due to his energy and thoroughness. He asserts that money can be made in growing any farm crop, or raising any kind of stock, if everything connected therewith is done at the *right time* and in a *thorough* manner, and he *proves* his assertions. One mistake made in his early experience was trying to farm a large quantity of land with an insufficiency of teams and implements, thus working at a great disadvantage; another was in doing too much of the heavy farm work himself, instead of hiring additional help and attending more closely to his stock and other important details. He makes a large quantity of manure every year, but relies principally on a systematic rotation of crops, including pasturing with sheep and cattle, as the means of keeping up the fertility of his land. He has ample machinery for handling the various crops he grows and takes the best of care of it. He has as nearly a model farm as can be found in this part of the State, and his home is surrounded by evergreens and well protected on the west and north by a large grove of maples. He is a great reader of practical and philosophical works, and of journals of the highest class. He is a school director and a firm believer in the merits of our public school system. As will be seen, his portrait indicates the thorough farmer—practical, energetic and a master of his vocation.

No. 3 is Mr. M. Beaty, the youngest member of the group. He was born and reared on a farm in Indiana. Practically he began life in the Union army, serving three years and coming out with a little money, most of which he spent traveling over the Western States looking for a suitable location in which to establish a home. Having settled in this vicinity, he began farming on leased land and after a few years purchased a farm, going deeply into debt for it. It took several years of hard work and the closest economy to lift that burden off his shoulders, but grit and persistence finally won and he came out with flying colors. He is now worth something over $8,000 and deserves every cent of it. One of his best strokes in farming was leasing new land and sowing it to winter wheat. He has made several mistakes but none that proved very disastrous. He is an advocate of mixed farming, believing it to be the safest in the long run. He grows considerable wheat, but more corn. With these two crops he is very successful, chiefly because he takes great pains to prepare the ground thoroughly before putting in the seed. He has been only moderately successful with hogs. He puts great faith in sheep and is steadily increasing and improving his flock. He wants to have nothing to do with cattle. He believes quite strongly in clover as a means of renewing and conserving fertility. He is a hard worker, a good manager and a successful "all-round" farmer. Mr. Beaty is a very quiet man, keeps himself well informed, is rather conservative in his views, attends strictly to his own affairs and is highly esteemed by his friends and acquaintances. He is a school director,

1 2 3 4 5

FIVE REPRESENTATIVE ILLINOIS FARMERS. Fig. 306.

an earnest advocate of our public school system and takes great interest in the cause of education.

No. 4 is Mr. G. E. Maxon, a native of New York State. He was reared on a farm and at the age of 17 years came to Illinois with an empty purse and began life for himself. He worked steadily and carefully, saved his earnings until he was able to buy a farm for himself. Believing that there was more profit in raising and feeding stock than in exclusive grain farming, he soon became the owner of a herd of cattle. Close observation convinced him that there was money in Short-horn blood and he forthwith introduced it into his herd. This, together with his system of hastening maturity by means of good shelter and an abundance of food, enabled him to make money while others lost. As the profits of cattle-raising and feeding were cut down by the development of the business on the Western plains, he gradually changed to sheep and draft horses, and out of these he has made considerable money. He says that sheep have proved the most profitable stock he has handled, and one of his greatest mistakes was in farming without them. He has raised and sold quite a good many very fine draft horses. He advocates mixed farming—growing grain and grass and feeding them on the farm to stock of the *best* quality, limiting the numbers so that each animal will have the best of care and an abundance of food from birth to maturity. In connection with his farming operations, Mr. Maxon is engaged in buying and shipping fat stock. As his appearance indicates, he is energetic and enterprising, a close observer, watchful of his own interests and quick to adopt any device or practice that will facilitate operations on the farm or enhance the comforts of his stock and increase his profits. He is greatly respected by a large circle of friends and acquaintances, and last Spring was elected supervisor of his township. He now resides in the suburbs of this village and communicates his orders to the farm, one mile distant, through a private telephone.

No. 5 is Mr. T. F. Potts, a native of Illinois. He was reared on a farm and began to hoe his own row at the age of 21 years. He inherited a small amount of money to begin with, and this he employed to such good advantage that he soon accumulated quite a nice property in land and stock. Being of a rather genial and social nature, and placing a broad construction on the command: "Love thy neighbor as thyself," he was imposed upon by friends whom he was trying to assist, just at a time of great financial depression, and this gave him quite a severe backset. Nothing daunted, however, he resolutely pressed forward—worked a little harder, and economized a little closer, and in due time recovered all he had lost. He is now worth about $20,000. He has made quite a handsome sum in breeding road and general-purpose horses. For this branch of farming he has a great liking. He is firm in the belief that however depressed the market for common stock may be there will always be an active demand for well-bred, stylish horses, at prices which will justify a man in expending a liberal sum for first-class breeding animals, and taking the best of care of them. He keeps between 300 and 500 very good sheep, and thinks they have yielded him a larger profit, from the investment they represent, than anything else he possesses. He takes considerable pride in this flock, and they are given the best of care, and this is, probably, the reason they have paid so well. He is a firm believer in the fertilizing and beneficial mechanical effects of clover and sows a great deal of it. He is confident that his land is richer in plant food to-day than when first broken up. This has been brought about by means of clover and sheep. He keeps a considerable number of cattle and hogs, but devotes his attention so largely to horses that this branch of farming may be considered a specialty with him. Mr. Potts is something of a speculator, but a very cautious one. He usually has an extra iron or two in the fire, but he manages so well that he rarely gets any of them burned. His appearance indicates the quiet, speculative genius. He is a school director and a great admirer of our public school system.

NOTES ON 1889

WHICH IS NOW

A "BACK NUMBER."

CROPS THAT PAID BEST.

PLANS for the FUTURE.

1. What crop or product has paid you best during the past season?
2. Why, in your opinion, has it paid you best?
3. Will it pay you to increase this crop or product for next year?

NEW HAMPSHIRE NOTIONS.

THE product of the farm that has paid the best considering the cultivation and the expense of harvesting, has been that of the orchard. Why was it the most profitable? First, because of a good and lively demand for the fruit, which insured a good, fair price per barrel. This season anything that was an apple could be sold without urging, at a profitable price. Again, the expense of gathering was low. Barrels were purchased at 40 per cent. discount on the usual prices. My fruit was less wormy than in '88 and there was a heavier crop per tree than ever before. The pickers were intelligent and trusty—capable of sorting and packing their own pickings, which they did from their baskets, thus avoiding expense and many bruises on the apples. Why was the proportion of wormy apples smaller? It was owing to the spraying of Paris-green and the increase in yield. It seems to be a fact that in a thinly-fruited orchard the apples are nearly all bad—that is wormy—and that there are no more pests in the orchard if the trees bear heavily. On a tree bearing one bushel all the fruit is poor, while on a tree bearing more than one bushel there are no more bad fruits than on the first. Then if the yield of the orchard is increased the culls will remain nearly the same in quantity as now, and the increase in fruit will be a profit. Five years ago there was gathered from a neglected orchard only fruit enough for our own home use—during my first year here this season the product was 460 barrels besides what was consumed in two families consisting of 12 persons, and windfalls that were thrown into the hog-yards. The orchard is kept seeded to grass and this product has doubled since I began to work among the trees with the saw, plow and stable manure. The foliage has changed from a sickly green to a thick, dark green and each tree presents an appearance of health and luxuriance and produces an abundance of new wood each year.

Next year I expect to harvest from the orchard the largest crop that it has ever borne. This year each tree has received an application of manure as a top-dressing spread as far as the limbs extend. Next year this dressing will return good interest by increasing the size of the fruit and by forming blow-buds for "'91." By such means I expect a good crop each year (Providence permitting). Now why should a half-starved orchard bear a full crop every year any more than a half-fed cow should give a maximum yield of milk or make the greatest possible amount of butter? Will young stock grow without feed, or horses do their best work when half-starved? Why, everybody knows they can't. The profit on any crop depends not so much on the price it is sold for as on the cost of producing it. To reduce the cost of production is to increase the profit in the same proportion. The capital invested in trees and land is just the same whether the orchards bear or not. The interest and tax remain the same, fruit or no fruit. The cost is less per barrel in gathering from a full than from a "scattering" tree. There are fewer poor fruits and, finally, by having a good crop of fair fruit every year one is able to secure a quick sale at the very best market price at any time when the crop is ready to sell. J. E. S.

Concord.

MY chief work last year was the erection of a barn. The business which seems to pay best in this section is dairying by selling either milk or cream to the creameries. The land is well suited for this industry. The products are in a concentrated form, and the prices received are fair—an average of 22 cents for butter, and the price of milk is on about the same basis. I think it will pay for us to increase our product for the coming season. S. C. H.

Henniker.

MY apple crop paid me best the past year, as it also did in 1888, because it is raised at the least expense. My potato crop was good; I tried to raise 200 bushels to the acre. Had it not been for rot, it would have been a paying crop. The hay crop was good, but there has been no money in it. Stock is so low it will not pay for the labor. I could do something raising lambs if we had a higher duty on wool. J. S.

Wadley's Falls.

POTATOES have been my most profitable crop the past year; because I have raised a good crop while most of my neighbors raised a poor one and my potatoes will be sold in the local markets. I raise no other crop so liable to vary both in yield and price as potatoes. Raising potatoes is like putting money in a lottery. I think, however, that in a series of years potatoes have brought me better returns than any other crop, and I shall somewhat enlarge the area planted next year. A. P.

Hanover.

MICHIGAN MEN MAKING MONEY.

THE most profitable crop on my farm the past year, and in fact for several years, has been that from my apple orchard, and this I shall enlarge until I cover that portion of the farm which I consider adapted to apples. Of general farm crops the past year, clover has given the largest margin of profit after paying for the labor and the use of the land, and this too whether I refer to the portion kept entirely for seed, or to that which was cut for hay and then allowed to ripen seed. My aim in farming is to so use the land that every crop shall make a margin of profit and still leave the land richer at the close of a course of rotation than it was at the beginning. Although I have not always received the largest cash returns from clover, yet a series of 10 years has shown that it is quite profitable, and the land is much more productive than it was even five years ago. Perhaps if I had been a more skillful feeder it would have paid better. I have not always received as much for the hay fed on the farm as it would have brought if sold; but then I had the manure and I believe in putting the clover through the animal machine and getting what I can out of it, Mr. Terry to the contrary notwithstanding. One-third of the tillable part of the farm is in clover and I shall continue to keep that proportion in clover until it fails to pay. My rotation is clover and spring wheat. The other spring crops are oats, corn and potatoes. Only enough oats are grown for the horses. Many people about here do not like sowing wheat after corn; but I find it profitable and have never lost a seeding of clover in wheat sown after corn.

Mason. W. B. R.

WHEAT is our money crop; but owing to the grain aphis it was nearly a failure in this vicinity this year, many acres being entirely ruined. Grass, including the clovers, paid me best this year, and my acreage of clover is largely increased. What with tariffs and lice, trusts and potato bugs and business men's associations, "to maintain legitimate profits," as they put it, they to determine what are legitimate—the farmer has been so throttled that his profits are *nil*. A. G. M.

Fremont.

AMONG all the fruits, both large and small, grapes and pears have paid the best, and among vegetables celery. On account of the cold, backward spring and the drought in summer, all other vegetables have met with unheard-of failure. The above are my specialties. It is becoming understood more and more every year that in farming, as in everything else, success follows only well-directed efforts in some one or two lines of activity. Then on account of the general failure of the above crops in this State as in many others, prices have been better than usual. It will certainly pay me to increase the above crops next year although labor is difficult to obtain. W. F. B.

Ann Arbor.

MILK, hogs, wheat and clover seed are the principal cash products of my farm. Milk has paid the best during the past season. It is shipped to Grand Rapids. I get one cent a pound from April to October, and one-fifth more from October to April. The price is fixed on October 1st for the coming year and has not varied for the last four years. It paid best because the price is fair and fixed, so that I know what I am working for. I feed liberally of bran, corn and oats. I think that at the present cost of these materials there is no more profitable stock farming than all-the-year-round dairying. I can see that my fields are getting more fertile and my debts are getting smaller. H. F. B.

Wayland.

RYE has been the best paying crop in my immediate neighborhood during the past year. It has paid best this season because all other crops were more or less failures, owing to an extremely wet spring, followed by an extremely dry summer. Rye seems to be able to yield a fair crop when all other crops fail; consequently much more rye was sown in my neighborhood the past fall than ever before.

Holland. C. F. P.

I AM on a small farm, and feed all the grain, except wheat and clover seed, on the farm. My largest profit comes from a pair of good brood mares. They do all the work on my farm and raise a good pair of colts each year. Next in order are sheep. I shall try to increase my stock by adding one more brood mare so that I can have a three-horse team for the harvest work. I think I know that farming does pay.

St. Louis. T. L. K.

THE apple crop has paid me, and a majority of the farmers of this State, as well as anything—no doubt better for the amount of money invested and the labor spent. The crop in this State has been simply immense and the quality was never better. It will pay to try to increase and improve the crop, which has brought into this State an immense sum of money this year, by cultivating and manuring the orchards, removing worthless trees, pruning over-luxuriant ones, not cropping the ground, etc. My orchard, which is used for a park for a large flock of hens, and which has been frequently plowed for their benefit during the last two years, has brought more money than for 20 years, although it is very old and nearly one-half the trees have been removed within a few years. I cannot close this letter without acknowledging how deeply I am indebted to the RURAL NEW-YORKER. There is no paper like it—no, not one, and especially have I been benefited by the practical writings of Mr. Terry whose letters I had read long before he became a contributor to the RURAL. This man is doing, I think, a grand, good work. Who knows but that we may be near a revolution in farming? He raises crops which yield more than double what most of us can grow and without keeping more stock than is necessary to work his land, while the most of us think that we must keep stock enough to eat all we raise in order to keep up the fertility of our land and this causes constant drudgery indoors and out, especially if cows are kept. I would like to have Mr. Terry suggest a rotation for us who are too far from a market to raise potatoes profitably. G. W. D.

Davis.

THE best paying thing on my farm this year was hogs. I wintered 21 pigs, (dropped in October, 1888) weaning them December 10, 1888, and feeding them all winter one-half basket morning and night. On May 10 I turned them to grass, and allowed them to come to the pen at night for 33 pounds of shorts (cost 70 cents per 100 pounds) which had been soaked three days in water. On May 15 I purchased a Poland-China boar pig and turned him with the

drove on June 10, 1889, as there were 13 sows in the lot and eight barrows all pure-bred Poland-Chinas. On the 5th of October I advertised them in several papers: viz., 13 Poland-China sows due to pig in October for sale for $2 for each pig and the sow to be gratis. They were all sold except two, and they have 17 pigs which I will sell in the same way. The eight barrows were penned on September 20 and fed 50 pounds of corn-meal per day and sold for ($85.40) four cents per pound on October 10. The sows sold for an average of $16 apiece. The boar was sold on September 12 for $12; I had paid $15 for him. It will be easily seen that I was feeding those pigs at the rate of just one cent per day for each in corn in winter and shorts and pasture in summer. They had the run of stubbles and orchards in September and October. Pork brings the best price. Spring pigs find too many holes so I can't pasture them and they don't get very large until December; then they can bring only small prices in market. I never go heavily into any one thing. I keep up a regular rotation of crops: corn, 30 acres, grass or hay 30, oats 30 and wheat 60 acres. I also keep 25 or 30 head of Short-horn cattle, 200 grade Merino sheep and 10 horses and colts. I raise or buy two colts and sell a team each year. I moved on this farm with my parents in 1847 from Monroe County, N. Y. J. F. F.

Almont.

VARIOUS VERMONT VIRTUES.

Unlike some of the correspondents of the R. N.-Y. who make a specialty of a few crops, I carry on mixed farming in quite a broad sense of the term. I carry on what I call general farming in a small way; that is, I keep a few cows, sheep, hogs, etc., and then do quite a business at truck-farming or gardening, and also raise some fruit for market. Our main market is Rutland, 6½ miles distant, and we don't find it takes much more time to take a load of various products and get $15 or $20 for it, than it does to go with three to five dollars' worth. As to which crops pay best, as the yields and prices vary every year, it is hard to tell. For instance, in 1888 I sowed a quarter of an acre of Yellow Danvers Onions and had a good crop and sold early and got good prices. This last year I sowed half an acre and hoed and weeded them twice, and then lost them through the maggot; but I shall try onions again next season on a different piece of land and put on lime and salt for the maggot. Again, my early potatoes this year were good; but two acres of late potatoes, planted for late marketing and winter use, were nearly a failure; but I shall plant potatoes for late marketing again another season. It takes pluck and perseverance to succeed in farming as well as in any other business. Sweet corn, tomatoes, beets (for bunching and selling early) and pole beans paid the best of the garden truck this past season. Currants paid me best in the fruit line and my small dairy of cows paid best in the general line. I shall try to increase all along the line, except in raising small grains. Farming will not pay in this section if one sits down and looks at the work—he has to go at it and make it pay. I am not in love with all kinds of farm work, but I am in love with the old farm that my grandfather and father before me tilled. My gross income for 1889 will be about $2,000. I can give the exact figures at the end of the year—and this on a farm that probably would not sell for more than $3,500 at auction; but I don't want to sell, nor am I going to abandon it. I am sure the income can be doubled. Twelve years ago the gross receipts were $450. C. P. S.

East Clarendon.

JERSEYMEN JUDGE JUSTLY.

THE potato crop in the first place and the hay crop in the second are the crops from which I expect to realize my profits if there are to be any. Owing to the excessive rains of last season and the low prices, I am of the opinion that New Jersey farmers are to have a hard time of it, and that in many cases the balance will be on the wrong side of their accounts. I believe the potato crop will prove the best paying crop even with the risks attending its growth. It never entirely fails to be a paying crop in a greater or less degree, and whenever it proves a fairly successful crop it pays well; otherwise it leaves our soil so thoroughly improved that only a slight outlay is needed for the wheat crop which succeeds and in ordinary seasons we are assured of a maximum wheat crop and splendid grass crops for two years thereafter. Next in importance is our hay crop. These are usually our paying crops. For myself I propose to continue my present system. All my yard manure is applied on sward for corn; then come potatoes, wheat and two years of mowing. I shall make an extra effort with my potato crop next year using only chemical fertilizers—and that freely—considering this the basis of all subsequent crops.

Cranbury. D. C. L.

HAY pays best. Potato raising with me seems to be a risky business; only once in a while do I get a good crop, and then the tubers rot. Last season two-thirds rotted. Being located near Newark, taxes are high and so is labor. I conclude that it is best to plow sod in the fall, cart the manure out during winter, put in a cultivated crop next summer and put on rye and seed to grass in the fall. W. V.

Franklin.

ALL crops have been very poor hereabouts this year, with the exception of hay, but a great part of the latter was gathered in a very bad condition. Wheat was a half-crop; the oat crop was very light. The greater part of it was damaged by the rain. Corn was a half-crop and potatoes not half. What there were have rotted very badly.

Mendham. B. H. L.

MY two paying crops for the past year were early tomatoes and Yellow Globe Danvers Onions. I transplanted my tomato plants on two beats; by the first of May, they were fine, large plants, some in blossom. Then I transplanted them into my cold-frame and covered them with canvas frames for a few days and nights; they scarcely felt the transplanting. I had tomatoes in market far ahead of other gardeners around here and got 15 and 20 cents per quart, wholesale, for a good many peach-basketfuls. I intend to increase this branch of my business next year. My onion seed I always sow quite thickly and make three sizes in sorting the bulbs—large, pickling and sets. I raised 50 bushels from one pound of seed on less than one-eighth of an acre. W. P.

Kingston.

THE grass crop has paid much the best; first, because the season was favorable to the growth of grass, and very unfavorable to grain raising on account of wet and cloudy weather. The hay crop was the heaviest, to my knowledge, ever cut in this neighborhood, while the crops of grain were the poorest, both in yield and quality. In our plan of farming I do not think it would be wise to increase the area of grass land, as in order to keep the live stock clean and comfortable a certain quantity of straw seems to be indispensable; but it is my constant aim to increase the yield of grass by drainage, the use of lime and manure, clean seed and plenty of it, etc. I sow Timothy in the fall, and think that where I lose a sheaf of wheat by it I gain a load of hay. I sow clover seed in April, and pasture the land the first year, when the growth is mostly clover, and mow it the second season when it is about three-fourths Timothy and makes excellent hay, easily cured, etc. I cut four tons to the acre on a part of my land this year—75 two-horse loads from 20 acres. I never had so heavy a yield before. Pasturing was also abundant. D. J. B.

Harborton.

IOWA INDICATES INCREASE.

THE familiar expression that corn is king in Iowa, may be quite as truly applied to my farm as to my State, It is the most important crop that I raise. It is the crop that absorbs the attention of this whole region. Every successful farmer raises all the corn he can, and it is to be feared that he too often sighs because he cannot raise more corn. But at the present price—20 cents per bushel—there is no profit in raising corn to sell. The profit—whenever there is any—comes from feeding good, thrifty, swine. My hogs are my best paying product. There was a time, perhaps, when fat steers paid as well as fat hogs, but that time has passed. For a number of years we have been making our money out of the swineherd and we expect to continue to make it in that way for years to come, for doubtless the present depression of the market will not continue a long time. But where is our profit this year? Dealers are paying $3.25 per cwt. alive. The profit is certainly very small. I think it will require a microscope with power to magnify about 15,000 times in order to see it at all. Yet there is more money in three-cent pork than there is in 20-cent corn. One year ago we sold prime hogs for $5 per cwt. Then we made some money. Every farmer who was ready to sell at that time and did sell wore smiles. Probably we then received surplus enough to balance, in part at least, the deficit this year. We have to estimate our profits not from the prices of any one year, but from the average prices of longer periods when all the ups and downs of an unstable market may be equalized. It is from this larger view of the situation that I answer as above the first question propounded by the RURAL. A few fine young horses are also profitable ornaments on this farm, and a small dairy helps to make profitable pork; but these branches of farming are only supplementary. The extensive corn-fields and large droves of swine all over this country are sufficient proofs that the great majority think alike.

Here is a little anecdote to illustrate the usual fate that befalls the man who tries to get up a little rebellion against our King Corn: Mr Blank, one of our highly respected citizens, made potatoes his specialty this year. The work was all well done and the season was very favorable. He harvested a bountiful crop, but, as the RURAL has already noted, we have a superabundance of potatoes. Accordingly Mr. Blank "cast a wishful eye" toward Mr. Terry's market. I suppose he concluded that Mr. Terry and his co-laborers had not supplied the good people of Ohio with potatoes enough, so he sent away two carloads to that State. I cannot state all the particulars of this transaction, but it is sufficient for my purpose to say that Mr. Blank was greatly amazed to see the railroads pocket the entire receipts. He will not raise potatoes next year. He will be found plowing corn.

This brings me to the second question: "Why?" The reasons are found in the fitness of things. This is the fittest country in which to grow corn. There is the most perfect adaptation of soil and climate to its production. Corn is the fittest food for making fat hogs. Let me stop right there. It is a clear case of "the survival of the fittest," but I do not wish to go on and state that the fittest food for the people is pork. However, so long as man continues te eat the hog, so long, I reckon, will the great corn belt furnish him with his ham and bacon. D. W. F.

Mt. Vernon.

NUBS OF NEW YORK NEWS.

MY farming is mixed. Some wheat, corn, barley, hay, colts, butter and beef are raised, besides some fruits, but nothing except a few eggs has been marketed this year. My opinion is that the farmer who has done the least, and has fodder for stock and lets the rest go back to the soil is the best off this year. No farmer can pay the present price of labor, sell his produce at the present prices and make any money. In fact, he had better just try to make a living and no more until the surplus of farm produce is consumed and fair prices are paid. W. H. O.

Clyde.

I FIND that beans have paid me much the best, considering the labor and time expended on their culture. The supply not being up to the usual average, they are in brisk demand and prices high. I shall plant a much larger acreage next year, as they generally bring good prices. Blooded stock pay me finely, and the satisfaction derived from their care and improvement is very good. Three years since I invested in a few full-blood Holsteins, and now have 13 head of pure-blood and high-grade animals, from the noted Aaggie, Netherland, and Pieterje families, beautiful animals whose milk and butter and surplus increase are highly remunerative. I have also two very fine pure-blood Jersey cows, bought to test the comparative merits of the two breeds, and so greatly do I favor the Holsteins that I may say the Jerseys are for sale, as I shall keep only Holsteins in future. J. M.

Nunda.

OWING to the wet season some crops did not do as well as anticipated, as I had a considerable wet ground under the plow. I had three acres of planted corn and about four acres of fodder-corn which was put in in the expectation that I could cure it; but as the season advanced, seeing that I should be short of winter feed, I finally decided to build a silo, and being quite a distance from the mill, a good deal of the labor was done by hand, such as hewing, etc. The bottom was filled with pounded stones and grouted. I commenced cutting my corn September 10 and began filling the silo on September 12. We were not quite a week in filling it and we covered the top with bog grass and weeds. To-day (Dec. 11) we are using the silage from the silo, feeding the cows twice a day from it with a little grain and hay once. We picked off the best ears of our planted corn and left them on the ground to dry or cure, and put the fodder and small ears in the silo. The other was put in with a drill so thickly that it would not ear. The corn was put into the silo without cutting and it comes out in fine condition. I intend another year to plant ensilage corn so that it will ear, and I shall cultivate it, and it will be put in without cutting, the same as this year.

Tallette. J. E. T.

MY potato crop has paid me the best the past season. In my opinion it has done so because the crop has been short in many sections, hence the price has been high. I had a very nice crop and sold them for 50 and 60 cents per bushel from the field at digging time. I hardly think it would be wise to increase this crop for another year.

Canastota. O. L. S.

CABBAGES and onions were the best paying crops that I raised, as there is a home market in which cabbages are sold readily for from $6 to $8 per 100, and onions for $1 per bushel. The cost of raising an acre of cabbage is less than that of raising an acre of corn. B. T.

Moriah.

The peach crop has paid the best the past season, on account of scarcity of peaches in other sections, which has made prices high here. It will pay me to give special attention to the fruit crop, as I can grow and market it at a less expense and greater profit than grain, even though the prices were much below those of the past season.

Youngstown. A. J. B.

THE corn crop was the most profitable this season, as corn yields both grain and fodder; but generally the potato crop is the one from which we get the most money: but this season potatoes were very poor. The business that has paid me the best for a number of years is dairying. Butter-making pays me the best as I have good customers through the summer and fall, and sell my butter at 30 and 40 cents per pound; but from now until June next we do not have much call for butter. There is also a good deal of cream and milk sold here in the summer. Yes, it will pay to increase the ability of one's farm to carry the stock through the winter in good condition. I saw a piece in one of the papers a short time ago, telling how a Mr. W. R. Devan of East Rodman, churned 57 pounds of cream from 376 pounds of milk which had been centrifuged, and received 14½ pounds of butter, being one pound of butter for about four pounds of cream from native cows. Now, this morning (December 3) I have churned 49 pounds of cream and received 14¼ pounds of unsalted butter, being about one pound of butter from 3½ pounds of cream. I use the Cooley Creamer and the Davis Swing Churn. I stop the churn when the butter is from the size of wheat kernels to that of a kernel of corn, and wash it thoroughly and salt it to suit the taste of my customers. In some there is no salt at all and that brings the highest price. C. H. B.

Southampton.

OUR chief product has been milk for the New York market, and the crops of the most value in producing milk the past year would have been hay and grass, had it not been so wet. Corn drilled and in hills makes a good crop for milk production. On an average I think apple orchards pay the largest profits. Milk has paid best the past season, because we can keep more stock by buying ground feed and also by cutting all our coarse feed with a horse-power. The cows use it all up and it makes more manure. G. J. G.

Yorktown.

MY farm consists of 10 acres of land and the necessary buildings. I produce for sale small fruits, onions, squashes, some sweet corn, milk and honey. I think the milk pays as well as anything, if not better, because I have a good warm stable, feed well the year round, and sell the milk to the neighbors who pay a fair price for it (in comparison with the prices for other farm produce) and come to the house after it.

Schuylerville. T. E. B.

POTATOES have paid me the best the past season. The yield was about 200 bushels per acre. I shall plant potatoes and cauliflowers for my principal crops next year, as they are the only crops from which we can get much money. H. F. R.

Riverhead.

In this region corn, oats and potatoes were an entire failure on account of the continuous rain. Early-sowed buckwheat was a fair crop. My grass was good. I cut nearly two tons to the acre. I do not feed my meadows off in the fall or pasture them in the spring. I put my manure on them as a top-dressing and it makes a heavy sod. Then when the land is under the plow I consider it rich enough to produce any crop put on it in an ordinary season.

Whitney's Point. J. H. K.

I think poultry and eggs have paid best, according to the money invested. I think it about as well to continue the regular routine of crops with some stock and young horses and about 100 fowls, raising also some sheep, pork, dried fruits, etc., etc. Some around us are raising from one to five or six acres of tobacco and claim it pays best and they intend to continue the business. H. C.

Wolcott.

My best crops the past season were wheat, oats, hay, seed and pasturage, making an increased amount of butter on account of the abundant pasturage. I attribute the very large hay crop—3½ tons per acre on 12 acres of new meadow and over 60 tons on 30 acres of older meadow—to the abundant rains in the fore part of the season; but this cause seriously damaged corn, beans and potatoes, and also evidently injured the fruit crop. I shall go right on with my regular rotation of crops, and trust to Providence and good management.

Johnson's Creek. J. M.

For the money invested and the labor laid out, corn sowed in drills three feet apart, and about one foot in the drill, for fall and early winter feeding of milch cows has paid as well as any, because it has come at a time of the year when other feed is mostly gone and it produces a good flow of rich milk when butter and cheese are bringing better prices than when grass is plentiful. I think it will pay to improve the crop both in quantity and quality.

Sherburne. D. J. P.

This has been such an exceptional year, and one which has caused so many losses to farmers, on account of the constant rain, that in this vicinity it is hard to speak of any crop that has been a paying one. The only crop I have that pays anything is beans, and it pays because only a comparatively small acreage has been planted in all this section. W. M. N.

Mt. Morris.

I carry on mixed farming. The principal parts of my spring grains, hay, corn-stalks and straw are fed out on the farm to different kinds of stock. I have for a number of years given most of my attention to the breeding of American Merino sheep. I think this business has, the past season, paid as well as anything on my farm, and I live in hopes that it will pay much better in the near future. C. C.

Victor.

In my opinion the wool crop has paid me better than anything else the past season, because, first, the price of wool has been better than for some years past; second, there has been no difficulty in disposing of my surplus sheep and lambs at good prices; and, third, besides enriching the farm, my sheep have paid me good interest by destroying piles of weeds. I think it will pay well to keep as many sheep as a farm can carry safely through summer and winter, if they can have plenty of good shelter to protect them from storms. Barley has been a good crop until this season: but overproduction or the "Brewers' Trust" has knocked the price of the grain so low that we can afford to raise only enough grain to keep our land seeded. Farmers in this community who depend on their grain to pay hired help, taxes, and interest on their farms, don't smile very much when they look at the future prospects for their occupation. T. & B.

Naples.

Potatoes have paid me better the past season than any other crop I have cultivated. I had only half an acre. I thought that would be all I could attend to and do them justice. From the half acre I harvested 125 bushels, 120 bushels of which were good and marketable, there being only five bushels of small ones. At harvest time potatoes taken from the field brought 50 cents per bushel. I think that pays well. I make farm dairy butter of the finest quality. I use the old-fashioned, shallow, eight-quart pans for setting the milk. I do not allow it to get sour before the cream is taken off. I supply some of the dairymen with butter, and send the rest of what I make to the city. Last summer I sent my butter to New York City and was getting from 22 cents to 23 cents per pound when the factory farmers were getting only 16 cents per pound. My butter this season will net me 23 cents per pound. Why? Because I make fine, fresh butter, not grease. In my opinion the farmer is most to blame if he gets low figures for his product. It is not because it is farm dairy butter that the price is low; but because its quality is poor. If the farmer would take a little time to think how he should care for his milk and cream, he could get as much for his butter as the creameries can for theirs. I have no trouble in getting the highest price for my butter, because it is of fine quality. W. H. P.

Columbus.

MASSACHUSETTS MATTERS.

Onions have paid me decidedly the best; and this in spite of the fact that the maggots, at a low estimate took 40 per cent. of the crop. Why? On account of a large demand in this vicinity for them, while there were comparatively few producers. Next year I shall increase the area devoted to the crop, having prepared the ground this fall as far as such work can be done at this season. W. H. B.

Leominster.

MAINE MONEY MATERIALIZES.

Sweet corn for the canning factory has been my best paying crop for this season. Strawberries usually pay me well, but the crop was a partial failure this year on account of the ground being bare so much last winter. I think it will pay me well to increase the crop by using more fertilizer and better cultivation. D. B.

East Baldwin.

Grass and hay are ahead among farmers in this section. We break up a few acres, sow with oats, then the next year plant with sweet corn; next year the land is seeded to grass with wheat or oats, so our farmers' leading crop is sweet corn. I can hear the whistles from four canning factories at my place. Most of the farms that are not forsaken, are little old New England farms. E. F. N.

West Farmington.

PENNSYLVANIA, PASTURE, POTATOES.

It seems clear to me that farmers cannot make any profit out of oats and corn by selling them off the farm at present prices—20 cents for the former and 30 cents for the latter. It takes 25 per cent. of the value of a bushel of corn to ship it to our nearest market, Philadelphia, only 125 miles distant. I think farmers would do much better by feeding all their oats and corn on the farm to sheep, hogs and colts. About the market price can be obtained for corn by feeding it to steers, but there is no profit in it at the market price. There is no market for milk. No milk is sold within a radius of 3½ miles of our railroad station. The surplus butter is mostly sold to the country stores. It is, of course, not of uniform character and is often sold very low, sometimes as low as eight cents per pound. At present it is worth 20 cents. If there is any profit in a butter dairy this ought to be a good location, as there are 500 cows within three miles of our station. I believe that a profit could be made out of oats and corn if fed to good cows, if we had a dairy to work up the milk. Our farmers are conservative—are slow to make changes. They have followed the five-year rotation so long, and have heretofore done so with such advantage, that they dislike to adopt new methods. But the continual depression in their business necessitates a new departure and I think that it should be by keeping more and better cows and by making butter. Our county—Cumberland—lies within the region mentioned by Hugh McCulloch, ex-Secretary of the U. S. Treasury, when he said that the only good farming found in the United States, was included within a radius of 50 miles of Harrisburg. Much of the land in the section mentioned is of the best quality of limestone. Many of the buildings are large, handsome and expensive, and this is particularly true of the barns. By following the five-year rotation, plowing down a clover and Timothy sod for corn, the corn being followed by oats, then wheat, and then two years in grass, the fertility of the soil has not only been maintained, but has in many cases been greatly increased. Of course we have no abandoned farms, but farms are hard to dispose of. Sales of limestone farms have been made this fall at from $60 to $90 per acre. J. P.

Greason.

My potato crop has paid me as well as any of my other farm crops this year. Though the conditions of the past season, agriculturally speaking, were adverse, this crop was fair. On one acre of Early Beauty of Hebron, and Early Rose, I dug 165 bushels of marketable potatoes. They were raised on dry red-shell land with about 600 pounds of Clark's Cove potato manure applied to the hill. I sold my crop at an average price of 85 cents per bushel. I shall double my acreage of potatoes next season. W. S. G.

Tompkinsville.

MINNESOTA MENTIONS MANY MERCIES.

Flax has been our best paying crop the past season. It is a favorite owing to its ability to rot "new breaking" and dry out wet land, also the length of time during which it can be sowed, as it does equally well sown in April or June, and it therefore lengthens our seed-time and harvest; and moreover, it is gathered without the necessity for twine. It will surely pay to try to increase the yield by growing clover on alternate seasons. Our next crop is Timothy seed, of which for 10 square miles hereabouts there are thousands of acres. Our crop the past season amounted to 2,200 bushels. Oats, barley, wheat, and corn come next. Butter and pork are also important products, as grasses of all kinds do well. What we most need is more farmers who want to make homes for themselves. Land is worth from $6.25 to $25 per acre. F. P. S.

Grand Meadow.

Here is a list of the crops raised here and their value per acre in our market: Wheat, yield, 28 bushels at 65 cents, $18.20; oats, 50 bushels at 15 cents, $7.50; barley, 35 bushels at 40 cents, $14.00; Timothy seed, 6½ bushels at one dollar, $6.50; corn, 40 bushels at 20 cents, $8; hay $5 per acre. Wheat gives the most money per acre, owing to the fact that we raise more than an average yield; but we can't risk much in it, as it has failed too many times. The grain and hay raised are mostly all fed out to cows, hogs, and horses. We sell some wheat and barley. Cows pay best. Good horses also pay pretty well. The man who tries to farm in Southern Minnesota must keep good stock or "get left." R. E. M.

St. Charles.

MARYLAND MUST MUSTER MORE MEANS.

Raising corn and tomatoes for canning has been the leading business hereabouts, but the low prices for these goods have put nearly every one in despair. Our great misfortune is due to the large size of our

(*Continued on Page* 858.)

Everywhere.

RURAL SPECIAL REPORTS.

Indiana.

Hamilton County, December 7.—Corn gathering is mostly done and farmers are about ready to begin preparing their year's wood. We have had but one light snow this winter, and it went away almost as soon as it fell. We have had very mild weather here so far; there has been a considerable amount of mud and the ground has scarcely been frozen enough to bear a person's weight. We have had as nice a time this last fall for preparing for winter as I ever witnessed. Wheat is doing well so far; if it would only look as green on April 1, how pleased the farmers would be. But we do not depend very largely on wheat in this section. Of course, a failure in wheat injures us, but it doesn't injure us like a failure in corn does. Corn and hogs are the products that bring us our money. When we have plenty of corn and plenty of hogs we have plenty of cash. There was almost any amount of corn here this fall that was chaffy and otherwise damaged so that it was rendered unfit for sale; but it was fed to hogs and the farmers realized a fair profit from it. I think it will pay me to increase my facilities for raising hogs. M. M. H.

Pendleton, Madison County, December 6.—Wet weather has continued through the fall till date, so that corn did not mature well. The yield is light, and the quality very poor. Not more than 60 per cent. of the crop is marketable at 25 cents. Once more with a light corn crop, hogs and pigs were fattened early; again, too, it occurs that as they are just ready for market prices have gone down. Farmers were reluctant to sell at $3.25 The pressure of a small corn crop is compulsory, and the market is lively. P. W. H.

Maine.

Bridgton, Cumberland County, December 14.—Sweet corn and hay are our two best paying crops. Farmers have abandoned the planting of yellow corn for the reason of low-priced Western corn. Sugar corn is substituted, as it pays fairly well and brings money soon after delivery to packers. Hay is fed in winter largely for butter, as silage is a thing of "the future" with us. Cheap cattle! This is one of the most serious conditions which confronts us. It will, no doubt, in the near future affect the price of our hay. P. L. C.

Pennsylvania.

Library, Allegheny County, December 12.—With us, hay has been rather the most profitable of our farm crops this season, because there was a heavy crop and it was for the most part harvested in good time and in good condition for market. A great deal of the hay shipped here is not in good condition and in our market, Pittsburgh, dealers do not like to change from the home product as long as such change can be avoided without considerable sacrifice. It would not pay to increase the acreage here because we rely entirely on our home market and the best customers have, heretofore, been the street-car companies and these are doing away with horse-power and the demand for home-grown hay is not increasing, but rather decreasing.

I am convinced that the raising of hay and grain in this section must soon cease to be relied on as a means of making money. Our farms are becoming cut up into too small areas and competition with our Western friends is too sharp to allow us much of a margin of profit.

Farm land in this section is worth from $125 to $200 per acre and 100 acres are considered quite a good-sized farm. I think the crops to increase are fruits and vegetables for our home market. Almost everything of this kind does well here and the demand is constantly increasing, and the margin of profit is much wider than in hay and grain. Farmers are conservative and it is hard to make the change, but they must come to it, or "go west." In the coming day of small things, I think I see the day of greater profits. J. C. B.

THE FARMER'S CLUB

ANSWERS TO CORRESPONDENTS.

SEEDING OATS AND GRASS.

J. W. T., Staunton, Va.

Some five years ago I bought a farm of 160 acres, and have since lived upon it. Being a merchant in Staunton, one mile away, I cannot work or superintend the work of the farm; but living on it, I am there morning and evening, and can plan and direct. Never having lived on a farm before, my whole experience in this regard is confined to the last five years. I do not, therefore, pretend to be much of a farmer, being not even a "book" farmer, but rather a "paper" farmer, as my knowledge of farming has been derived from agricultural papers and journals. Neighbors tell me my farm has greatly improved in these years, and I cheerfully give the credit to the papers. There are two things I wish the Rural to advise me about.

1. I have 25 acres in wheat. The ground was put in good condition, the wheat was seeded nicely, and is now looking well. With the wheat was sown Timothy seed—

one peck per acre. It is also doing nicely. My idea is in the early spring, say, in March, about the time of the "Crab," when the "sign is down," (provided the condition of the ground and the weather suit) to sow on the wheat one peck per acre of clover seed and roll it Should it be rolled? Is one peck too much seed? Would it be better to add other kinds of grass seed, and if so, what kinds? I want the hay for market, and the seeding to last as long as possible without plowing again. The 25 acres are in two fields, 10 acres being strong limestone land lying well to the sun, and 15 acres a medium quality of sandy loam with a Western exposure. It has all been well fertilized with complete fertilizers. 2. I expect to sow 20 acres with oats, and at the same time seed, say one peck each of clover and Timothy, sowing three bushels of oats. Am I wrong as to these quantities, and will it be better to use some other grass seeds? The hay is wanted for market, and to be mown as long as possible. Will it be better to sow the grass seed broadcast before sowing the oats, or should they be sowed by the grass-seed sower on the drill when the oats are seeded? Will it be well to use a roller after the drill? The soil is loamy and of fair quality. What variety of oats does the R. N.-Y. prefer?

ANSWERED BY HENRY STEWART, N. C.

A peck of clover seed per acre is heavy sowing, but many good farmers use as much as this. The writer has sown this quantity both of clover and Timothy for many years, believing that the thicker stand makes better and more hay. The time for sowing the clover is as soon as the land is fit after heavy frosts are over, and no doubt it may be sown in February with perfect safety. A time should be chosen when the surface is dry and cracked all over by a frost leaving innumerable small openings into which the seed will fall and be covered when the ground settles or when the first shower falls. The sign referred to may be safely disregarded, as the condition of the soil is the most important factor and the position of the stars in the zodiac or almanac has no effect upon what is occurring in or upon the soil. The suitable condition of the soil and the weather should be the sole guides. Timothy and clover will make the best hay for market, and if fresh clover seed is sown after the second year or the second-growth clover is left to seed on the ground, sufficient clover will remain. But the Timothy will not be at its best until the third year and with occasional top-dressings in the fall and some fresh seed will remain in good condition for 10 or 12 years. Rolling would be beneficial after the clover had been sown, if done when the land is dry. It will also benefit the wheat, especially if any of it has been thrown up by frost during the winter. But to roll wet land is exceedingly injurious. A seeding of 2½ bushels of oats is ample for an acre. The grass and clover seed is right in quantity, but it should be sown after the oats are drilled in, following the drill as closely as possible, so that the seed will fall on the fresh soil and quickly settle down into it; or if the ground is so dry that it will not crust after the roller, the land may be rolled as soon as the grass and clover are sown, and ample covering will be given to the seed by the rolling. As oats are apt to rust in the Southern States, the Southern rust-proof variety would probably be the safest. The writer has grown other oats in North Carolina safely three years out of five, but they suffered from rust the other two years. A heavy white oat called by the seedsmen "Clydesdale," and the Welcome Oat have done well in North Carolina and also in Virginia, yielding grain weighing 40 pounds to the bushel. It might be safest to sow half of the native kind and try half the field with a heavier variety which could be procured in Richmond.

GROWING ROSES FROM SEED.

F. K. Phœnix, Walworth Co., Wis.—The Editor of the R. N.-Y. has had *wonderful* success in growing roses from seed, whereas, after doing my best for three years in the open ground, I cannot get one seed to grow where I think I ought to get a hundred. Are good-looking rose seeds mostly good? They are so precious that I never dare cut or break one to see if it is good or not. How should the seed be treated under glass and in the open ground?

ANS. This is our method: The heps or fruits are plucked as soon as ripe and kept in a dry place until fall—say November 1. Then they are broken open, the seeds removed and planted. The R. N.-Y. uses shallow boxes of any convenient size about three inches deep. Holes are bored in the bottom and each is covered with a piece of broken flower-pot or something of the kind. These boxes are filled with about one-half of soil taken from under fences or old fields, one-quarter of *rich* garden soil and one-quarter of sand all thoroughly mixed together. The soil is well firmed in the boxes, especially about the edges. These boxes should be *securely* nailed at the ends and sides so that they will not spring apart.

The seeds are placed on the top of the soil in straight rows one inch apart—the rows one inch apart. Then each is *pressed down* half an inch and the depressions so formed are filled even with the surface with the same soil. The sides of the boxes are now half an inch above the soil surface of the boxes. These boxes are now removed to the garden and placed in any exposed situation elevated two inches above the soil and covered with wire netting which prevents birds, hens or other animals disturbing the soil. In this way they are left exposed to the elements until after a hard frost. The boxes are then covered closely and securely with boards and are so left until February 1st, or thereabouts. They are then removed to a little cool conservatory where they begin to germinate in two or three weeks. When they have grown two inches they are carefully lifted with all the soil that can be made to adhere to the tiny roots and planted in two to three-inch pots. They are thumped out and planted in prepared plots of the garden the latter part of May two by three feet apart. Here they make a growth according to the vigor of the plants until fall. The tender kinds must then, of course, be removed to pits or to houses. Those left out may be protected with straw, boughs or any suitable material, or if only hardy kinds are to be retained, a three-inch mulching of coarse manure will answer.

This season we have about 50 hybrids between Rosa rugosa (white and pink) as the mother plant or seed-bearer and many kinds of Hybrid Remontants and a few Teas as pollen parents. These we have protected in a way never before tried. The plants are in two rows about 50 feet long. These two rows are inclosed in a long box, one foot high by four feet wide. Over this box and extending a foot further over the soil outside is a quantity of coarse swamp hay, tomato and potato haulms, asparagus tops, etc., about six inches deep. There is no mulch inside.

There may be simpler, more effective ways of raising seedling roses and of protecting them through the winter. The R. N.-Y. gives merely its own experience.

We have never planted any rose seeds except those of Rosa rugosa. Consequently it is the mother of all our plants. These seeds in so far as we can judge are generally sound.

One year we planted the seeds, as above described, just as soon as they were mature, supposing they would sprout in a couple of weeks without having been frozen. There were no signs of sprouting when cold weather arrived.

FUNGOID DISEASE ON RASPBERRY CANES: HARDINESS OF BERRIES, ETC.

E. S., W. Bridgewater, Mass.—1. Among my Shaffer's Colossal Raspberries, I have noticed canes—sometimes there are a good many in a place—that have a scarred appearance. They are green, but the bark looks as if some disease was at work, or some small insect. Most of the canes have a healthy look. I send the R. N.-Y. some cuttings from the affected canes, thinking it can explain the cause. The soil is rather a sandy loam, well drained. I have used Mapes Fruit and Vine Manure altogether. The canes fruited the past season for the first time, and though cut well back because they had been winter-killed, they yielded a fair crop for a first one. 2. Hardiness in raspberries and blackberries is a puzzle. The Erie has been killed more or less, sometimes to the root and plants not far off have only been affected to a small extent. Those on a higher and drier soil have been killed more than some on a rather low place that is at times a little wet—soil sandy loam, becoming gravelly in the highest places. In the winter of '87-'88, Taylor Blackberry was killed way back, while the Marlboro Raspberry went through nicely; but last winter—'88-'89—the Taylor went through all right and Marlboro was killed to the ground. They are both in the same field, a sandy loam, well drained. The Cuthbert Raspberry seems to be hardy, and I have been surprised to see the Hansell Raspberry go through the past three winters uninjured, while the Marlboro has been killed two out of the three years. Hansell has yielded very well, and is a good bright-colored berry, of good, though not large size. Again, it seems strange that in a winter when the Erie Blackberry and Marlboro Raspberry have been killed, a few Wilson Jr. Blackberries that I have, should have lived unprotected. The latter are between the other two in the same field. We have had very little snow the past two winters. I make very little manure, and cannot buy nearly all I need at a reasonable price, and so have used chemical fertilizers for many things with very good results. Some of my soil lacks humus, and it has seemed to me that wood ashes and bone would perhaps be better than chemical manure, using nitrate of soda, etc., where needed. 3. Were the Canada ashes the R. N.-Y. has had from Monroe, Judson and Stroup satisfactory? I understand there are 50 bushels per ton. Parker & Wood, of Boston, offered them this season by the car-load, at $12 per ton. My soil is very similar to that in New Jersey, that is, between the light drift sand of eastern and southeastern Jersey and the clay lands along the Delaware and northern portions.

ANS.—1. We take it that the injury to the canes is of fungoid origin—for which there is as yet no known remedy. 2. Just such unaccountable behavior as to the relative hardiness of varieties has often been observed at the Rural Grounds. It can only be said, as to the raspberry and blackberry, that hardiness is a relative word depending upon conditions which are not understood. 3. Yes, the ashes were, as we believe, of high quality. Such ashes vary so much that their actual value can not be estimated except by analyses. The potash is worth the highest price, being carbonate—at least six cents the pound; the phosphoric acid eight cents.

BUCKWHEAT AS FEED: FEED FOR BUTTER.

N.R. T., Gainesville, N. Y.—Last spring I sowed a piece of sweet corn, and after cultivating it twice I sowed three pecks of buckwheat between the rows of corn. The two made a heavy crop. The buckwheat got ripe; the corn ears were just fit to roast when the crop was harvested. I am feeding this crop to cows together with about two quarts of meal to each, along with oats and peas ground together. I get a fair quantity of milk, but it makes little butter. The milk is set in a Cooley Creamer. What else should be fed to produce a good amount of butter?

ANS.—As we understand, you have been feeding the sweet corn and buckwheat cut and cured together. If so, this feeding is probably the reason why the milk is not rich in butter. Buckwheat straw is exceedingly poor feed and the grain, while it is productive of milk, yields milk of a poor quality. An excellent standard feed for cows kept for butter is mixed hay, half clover, and clear corn-meal, but the yield of milk will be larger, and more butter will be made, and hay will be saved, if the hay is cut and moistened—with warm water preferably—and the meal is mixed with it. A cow in full milk should have, at this season, at least two quarts of meal at each feed, and some cows will profitably consume three quarts, two feeds being given in this way, with about five pounds of dry hay at noon, or as much as is eaten clean and without waste. About five pounds of the cut hay will be eaten in the mixed feed at one meal.

GROWING CHESTNUTS.

H. G. M., Vernon County, Mo.—1. To a person intending to plant chestnut trees for profit in this part of Missouri, what advice would the R. N.-Y. give as regards soil, varieties and distances of the trees apart, general management, etc.? 2. Would seedlings be as profitable as grafted trees? 3. What price do the improved varieties bring in the market? 4. Would the chestnut be the most profitable nut to grow? 5. What other nuts would do well here and what soils does each sort require?

ANSWERED BY H. M. ENGLE & SON.

1. Chestnuts as a rule flourish fairly in light soils—sandy or sandy loam, slate and gravel—although we know of trees planted in rather heavy clay soil that grow and bear well. As to varieties, we have planted only the Paragon, Numbo and Japan, and shall not increase our stock of any except the former for profit. The distance most profitable for planting would be 15 to 20 feet, and when the trees begin to crowd each other, they should be thinned out to 30 to 40 feet. 2. Seedlings are too unreliable to be depended on for profit. 3. Paragons bring from $6 to $8 per bushel in our markets. 4. I believe good large chestnuts to be the most profitable of all tree nuts in proper soils. 5. Walnuts, butternuts, pecans and similar nuts flourish best in rich loamy soils.

UNITED STATES LAND OFFICES IN KANSAS AND NEBRASKA.

L. B. H., Paulding, Ohio.—To whom should I apply to find out where Government lands can be obtained in Kansas and Nebraska?

ANS.—To the General Land Office at Washington, D. C., or, perhaps, better, to the Registers of the local United States Land Offices in the above two States. Address an inquiry, with stamp for an answer, to the Register United States Land Office at any of the following places: Kansas: Topeka, Saline, Independence, Wichita, Kirwin, Concordia, Larned, Wakeeny or Oberlin. Nebraska: Neligh, Beatrice, Lincoln, Niobrara, Grand Island, North Platte, Bloomington, Valentine or McCook.

Miscellaneous.

S. W. S., Martindale, Pa.—What kind of trees should one plant along a fancy board fence on the north side of a farm?

ANS.—The R. N.-Y. would choose pears.

U. R. S., Mapleton, Mich.—1. Is the Ritson Pear blight proof as is claimed by an agent?

ANS.—The R. N.-Y. does not know of this pear.

D. C. A., Cattaraugus, N. Y.—We regard the Aspinwall potato-planter as one of the most ingenious farm implements ever invented. We are informed that the corn-planting attachment works equally well.

E. L., Cheektowaga, N. Y.—With us, hen-manure gives the best results on a light soil. We prefer to use it on sweet corn, melons, peas and beans. It is also good for cabbage. It is a good plan to mix sifted coal-ashes with the hen manure. Wood-ashes should not be so used.

J. B. R., Lettsville, Iowa.—Who sells Pea-combed Plymouth Rock Fowls? Our climate is so cold that all single-combed fowls in a severe winter have their combs frozen. I tried the Langshans and that was the worst trouble.

ANS.—H. S. Babcock, Providence, R. I., breeds these birds. We do not know that they are widely distributed yet.

A. R. Tabernacle, N. C.—The Monarch Incubator, made by James Rankin, South Easton, Mass., is a good one—perhaps as good as any for a beginner at the business, Will it pay to buy one? Will it pay to improve your stock, cattle, poultry or sheep? Not unless you are willing to give them the best of care and thought. Incubators pay some men while to others they prove only an expense. The profit or loss depends upon the way they are run.

L. L. W., Round Lake, N. Y.—Dorset Sheep are bred by Woodward & Jacques, Lockport, N. Y., and James Wood, Mt. Kisco, N. Y. This is a "special purpose" breed—chiefly valuable for producing early lambs for market. Twin lambs are very frequent when a ram of this breed is used and the lambs are well suited for the early market. The Dorsets are better suited to the methods of the man who has improved facilities for growing lambs than to those used by the "average farmer."

C. M. M., North Clymer, N. Y.—I am ditching a black muck swamp covered with flags, how long should it lie before seeding? What kind of seed would be best?

ANS.—The swamp land should receive this winter an application of lime at the rate of 100 bushels to the acre and be plowed and dragged next spring. It may then be seeded with 12 pounds of Alsike, five pounds of Timothy, five pounds of Red Top and five pounds of Meadow Fescue to the acre. If not ready now, the liming may be done next March or April, and the seeding take place the ensuing fall.

S. W. S., Martindale, Pa.—How far from a pump can I dig a sink without injuring the water?

ANS.—This will depend upon the character of the soil; where it is light and porous the danger is far greater than in a heavy, compact clay, because it is easier for the water to find its way through. We would not want a sink within 150 feet of our well.

Miscellaneous Advertising.

"Herbrand" Fifth Wheel for Buggies

In fact, we do not believe in a sink at all. It is healthier and neater to have a large barrel on wheels, which may be emptied twice a day. Sinks and privy vaults are nuisances. Your other questions will be answered later.

Discussion.

A VERMONT MAN "GOES WEST."

L. H. R., FORT ATKINSON, WIS.—In the R. N.-Y. of December 6, I see several letters in reply to questions in regard to the abandoned farms in New Hampshire and Vermont. I wish to say a word on that topic myself, as I am fully convinced that most of the reasons advanced by those correspondents are misleading and false. Before giving the reasons for the abandonment of so many farms in Vermont I wish to say that I always lived in that State until about a month ago, and have made some study of the matter, and after looking at the subject from all sides I thought it decidedly a good time to go west. Now for the reasons:

1. We in Vermont are no nearer markets in regard to the cost of transportation than the farmers in any of these Western States. In other words, the farmer in Vermont can sell his hogs, beef cattle, butter, potatoes, etc., at just the same prices as the farmers in Wisconsin, Minnesota and Iowa can theirs, and for no more. 2. The land in Vermont being hilly and stony, it is not possible to grow as many acres of crop with the same labor as in the Western States where the land is level or slightly rolling, and free from stones. 3. If the Vermont farmer wants to buy feed of any kind he must pay double price for it as compared with what it can be bought for here. When I left Vermont, a month ago, bran was selling for $16.00 per ton and corn-meal for $17 per ton and those were the lowest figures that had ever been reached there so long as I can remember, the prices often running from $20 to $25 per ton. The prices here are $8.50 for bran, and $7.00 for new corn on the ear. Now, does any one think that the Vermont farmer can make pork, beef or butter and sell it at the same rates as the farmers here can, with feed at one-half the price which the Vermont farmer has to pay?

4. The winters are from two to four months longer in Vermont than they are here, so that the people there have a much longer season for feeding their stock and a much shorter season for doing farm work, to say nothing of being blocked up in five to seven feet of snow for four to six months each year. 5. To my mind the most important of all reasons for the low prices of Vermont farms lies in the fact that every man or woman who has a few dollars to put at interest, instead of letting it out at an honest rate of six per cent. at home, must either put it into some Western mortgage company in Kansas, Nebraska or Dakota, or, even worse, send it to some of the many mushroom cities in the West and South, in expectation of getting eight or 10 per cent. or even more for it; but in many cases they lose even the principal. Now, I consider that the price of articles is regulated by three things—supply, demand and ready money, and as the ready money is all sent out of the State an important factor is wanting and prices go down, and as the supply of farms for sale increases they take another drop, and there being little or no money and plenty of farms for sale demand soon ceases and there is a crash in prices, just as there is at the present time. Mr. H. O. Hadley makes the following statement in the RURAL: "The only reason why there are so many deserted farms in the State is because the young men of today are too lazy to work." Perhaps that is the reason in his State of New Hampshire; but the case is different with the young men of old Vermont who have always stood in the front ranks for their energy and ability.

The reason why young men depart from the farms of Vermont is that they have looked the matter squarely in the face, and have seen their fathers and neighbors growing poorer and poorer year by year owing to the constant decrease in prices and the constant discriminations made in favor of the West by our railroads, and one by one they have arrived or are arriving at the same conclusion—that they can make more money in the rich and growing West than they can in the poverty-stricken East.

The New Hampshire farmers who have told readers of the R. N.-Y. the reasons why so many farms in their State and Vermont have been abandoned as unprofitable, are, nearly all, men who have farms for sale. It is therefore essentially to their interests to represent matters in the most favorable light to possible purchasers. All the world over, whenever a man wishes to sell his business, whatever it may be, really because he couldn't do well in it, he is certain to tell a different tale altogether to a would-be purchaser. The R. N.-Y. did well in calling attention to the subject and getting one side of the story from deeply interested parties; but, of course, it could not expect to get the truth about the matter from such a source.

VARIOUS TOPICS.

C. C. W., GRAND BAY, ALABAMA.—In an article by Dr. Henry Stewart in a late issue of the R. N.-Y., he speaks of the peculiar medicinal properties of the cotton root, and says the oil of the seed has the same properties. Now, if this is so, what quantity of the oil would be required to produce any effect upon a human being? Is not most of the cotton-seed oil now made used as human food in some form or another—as an adulterant in lard and olive (?) oil, and in other ways? I don't know how it is in any other places; but in Mobile refined cotton-seed oil can be purchased of any grocer, and is largely used in lieu of the miserable stuff called lard by the citizens for all sorts of cooking and shortening, and it is good too, but like many other so-called good things, its use may produce very serious results. Who knows?

One of my new neighbors is a man from Missouri, and the other day while reading the news of that blizzard out West, he remarked that he was thankful that he was out of the range of such things, and he didn't propose to face any more of that sort of thing as long as he could make a decent living here, and he had done very well so far, and as soon as he could get his fruit orchard to a bearing age he hoped to get along still better. When this man went back to his old home a little more than a year ago he told the people there what he had seen here and about some of his experiences, but he added that his stories looked too big and the people would not believe them. The above is brought to mind by reading on page 775 of the R. N.-Y. what Mr. Burpitt has to say about Georgia and the Island of Jersey. Suppose he were to return and tell those people about what he had seen and learned in Georgia: would they believe him? I doubt it.

The R. N.-Y. asks, on page 776, what is an acre of apples or peaches, quinces or pears worth when just coming into bearing. Well, I don't know how much the trees are worth, but I know the net value of the fruit from one acre containing 108 Le Conte Pear trees seven years old. The first crop, this year brought $626.40 and the trees are full of fruit buds for next spring's crop. I have not found the sort of apple that does well here. Peaches are unreliable. Of plums I believe the Japan sorts, like Kelsey, Satsuma and others, will pay well, as they bear large showy fruits of good quality, which stand transportation well, and can consequently be sent to distant markets at a season when they will sell for enough to give the grower a profit after a division with transportation companies and commission merchants.

I want to say "Amen," to Mr. Terry's Thanksgiving for fruit. To-day is Thanksgiving Day and we have just gathered the last of the fruits of the season—some Chinese quinces, many of which weigh 2½ pounds. The season began with the first week in March, when we gathered our first mess of strawberries, and ever since we have had some sort of fruit. For about eight months out of the 12, we can enjoy fresh fruits besides having melons from June till frost, if we plant in succession, and this we do, and seeds from the first melons planted at once produce a second crop.

CLOVER AND ABANDONED FARMS.

E. P., JEWETT, N. Y.—The issue of the R. N.-Y. for December 7, was an unusually good one, especially the letter of Mr. Terry and the articles in regard to abandoned farms. I am a believer in clover and always have been, and I think Mr. Terry's way of farming excellent for his farm, and at first thought I felt like saying: "Let us go and do likewise." But, instead, let us stop and think before we jump in—Have we all Mr. Terry's sub-soil to work on? Is not Mr. T. doing with his clover what could be done with a sub-soil plow? I think from my own experience on different kinds of land, that many who may try to follow Mr. Terry's footsteps to wealth will find, to their disappointment, that they have not his sub-soil, and that no clover will grow without constant manuring. I have known apparently worn-out land to produce as abundantly as Mr. Terry's by the use of a sub-soil plow, and the supply of fertility seemed to be almost inexhaustible. I can only say: "Happy is the man who has a farm with such a reserve for time of need," and I am sorry we are not all so fortunate. If others try experiments like Mr. Terry's I would like to hear from them. This is an important question, for if clover will do in all cases what it has for Mr. Terry then we farmers in the East are on an even footing with the owners of the new lands of the West and we are or will soon be rich men.

Now as regards abandoned farms: As far as my observation goes, really no farm is left to be abandoned. The farm was sold years ago in its products—butter, pork, etc. There would be as much sense in asking such a farm to produce profitable crops as there would be in asking the skeleton of a horse to rise and work. The young men who leave these farms know to their sorrow that nothing can be produced on such land without capital to restore the fertility and repair the dilapidated buildings. This capital they have not and they do not know where to get it, so they leave the farms to their fate. I am sure it is owing to the farmers' fault that farms are in this condition, for while the large majority of farms have deteriorated greatly in the last 20 years, a few have improved, and where the farm has improved the farmer has grown wealthy. I really do not think that farming has in the past had its share of brains. The parrot will croak that times are hard and "farmin' don't pay" until more capital and more brains are put into farming and until then farms will continue to be abandoned.

AGAINST THE SILO AGAIN.

A. T. T., FRANKLIN PARK, N. J.—I notice that it is charged that in my article of November 2, regarding the silo and the injury to milk by feeding silage, I have not plainly stated whether my silage was from corn well matured before it was cut or from green stuff, and it is also charged that I was not definite enough as to manner of storing it in the silo, etc. The corn was quite green when cut in the field and was quickly chopped and stored in the silo, where it was well tramped, covered at once and heavily weighted immediately. It would weigh 45 pounds to the cubic foot when taken out, and was moderately acid in taste, and when fed emitted an odor about the same as that of "barley grains." That there is a deleterious principle in this feed which is manifested in the milk, I think has been fully proven in the action of the condensed milk factories throughout certain portions of the dairying districts contiguous to New York City. These absolutely refuse to buy milk from cows that have been fed on silage. It is alleged that this action was not taken until heavy damage had resulted from the quality of the goods made from silage-fed cows. I am not prepared to deny that this obnoxious factor is eliminated in "sweet silage," and furthermore I will not assert that because I have never seen sweet silage, such a product has no existence except in the imagination of some silage enthusiast; but I will say that I have made silage from a variety of materials and stored it in a variety of ways, put it up fast and slowly, and it has never yet been my fortune to obtain absolutely sweet silage. Relatively some of it has been sweet, but only as compared with some that was offensively sour.

ABOUT POTASH.

F. A. B., ROCHDALE, MASS.—Do you put sugar into your turnips when you prepare them for the table? I should think there was sugar in this celery it tastes so sweet What very sweet strawberries these are! What is the name of them? Crescent. Why I thought the Crescent was a sour berry? It is with some. The above are actual questions which the writer has repeatedly answered at his table. The secret? Simply *lots* of potash. I mean by that, two or three times as much as is generally used or even more. I have used for years large quantities of wood ashes; also the Mapes Potato Manure at the rate of 1,200 pounds to 1,500 pounds per acre. I cannot get much barn-yard manure. I have raised celery on the same spot several years in succession, and this year the best crop I ever had. I have also grown parsnips year after year on the same spot and I sell them all in the fall. People say that they thought parsnips did not get sweet till spring; I say "Sometimes they don't; but mine do." I have never experienced any trouble from using very large quantities of potash in the form of ashes, except in the case of beets and potatoes. They will be more or less scabby in ground on which too large quantities of ashes have been applied. I have had about 1½ acre in a market garden for the past eight years and have kept it in good condition almost wholly with the Mapes manures and wood ashes, with occasionally a barrel or two of finely-ground bone on my small fruits—soil, a clayey loam.

THOSE CHEESE SYNDICATES.

COL. F. D. CURTIS, KIRBY HOMESTEAD, N. Y.—It is understood that an effort has been made to purchase and put under one management a considerable number of cheese factories. If, as the result of such purchase, more uniformity can be had in the quality of the cheese and a better grading, and this at a lower cost on account of doing business on a larger scale and thereby purchasing the material required at less cost, then the entire plan is a good one. If, on the other hand, the motive is to squeeze the price of milk down to a lower figure the movement is all wrong. I do not understand how such a combination can cut down the price of milk, for it is only factories which will be purchased not the farmers. The farmers will still have the liberty of personal and co-operative action. The spirit of co-operation is not an evil spirit providing there is not too much Mammon in it. Farmers need more of the co-operative spirit to reduce the cost of production and to induce more uniformity in the quality of farm products, and especially where they are manufactured. I understand that it is New York City capital which is behind this project. A combined interest in the manufacture and sale of cheese can be made to work good if there is not too much trickery in it. We shall see.

COAL ASHES AND CLOVER.

A. J. D., HACKENSACK, N. J.—In a late issue of the R. N.-Y. any person who has had experience with coal ashes is requested to state the results. The soil where I reside is sandy, and so light that when the wind blows it drifts in ridges, and nothing would grow on it except beans. I tried to get a sod on it by sowing Timothy, but it died out. A few years ago, however, one of our church masters informed me that there was a big lot of coal ashes in the church cellar and that he would give it to anybody who would haul it away. I hauled about 20 loads and spread it over a two-acre lot, and then with a light dressing of stable manure, I plowed it under and sowed clover seed, and to-day I have just as fine a sod on that lot as anybody can find in this county. I know it is the first time that sod has been on that lot in 30 years, and for how many years the same had been the case before I came here, I don't know.

WORTH NOTING BY CORRESPONDENTS.

E. P. S., W. BRIDGEWATER, MASS.—I have often thought that if contributors, in giving their experience, or the results they have obtained, would always mention the condition under which they had worked, what they say would be of more value to others than it often is. A dry season does not give the same results as a wet one. Chemical manure will do better on some soils than on others. Some soils seem to need barn-yard manure. Some crops do very well with chemical manures only, while others will do nothing with barn manure.

What Others Say.

ANALYSES OF FERTILIZERS.—Readers of the R. N.-Y. should study the bulletins issued by the various experiment stations, which give analyses of commercial fertilizers. Let us give a few instances to show in what way they may be benefited: According to a late bulletin issued by the N. J. Experiment Station, as pointed out by Dr. Collier in the Husbandman, of the samples of ground bone analyzed there were 10 which gave an average value of $40 per ton, the average selling price being but $32—that is, their real value was 26 per cent. greater than the price asked for them. On

the other hand, nine other samples of ground bone had an average intrinsic value, as shown by analysis, of $21.69, while their average selling price was $41.78, or 47 per cent. in excess. It will be seen, therefore, that upon the average those farmers in New Jersey who bought their ground bone from the last lot of nine samples, paid 85.2 per cent. more for the same amount of fertilizing material than did those who bought from the first lot of 10 above mentioned. Again, if we consider the so-called complete fertilizers analyzed, we shall find differences almost as great. For example, six of the number had, upon an average, an intrinsic value per ton of $31.88, while the average selling prices were $30.08—that is, they were, upon an average, worth six per cent. more than their market price. Twenty other samples had, as shown by analyses, an average value of $34.80, while their average selling price was $37.60, or eight per cent. more. Again, 50 other brands had an average value of $26.69, while their average market price was $37.69, or 41.2 per cent. greater. In other words, the New Jersey farmer who is so unfortunate as to buy some one of the 50 complete fertilizers mentioned, will pay, upon an average, 49.6 per cent. more for his nitrogen, phosphorus and potash than does the fortunate farmer who buys from one of the six first mentioned, or if one of the 26 first mentioned is bought, there would be an average saving of 34.4 per cent. over what would be paid for one of the last 50 mentioned.

SULPHUR AS A DISINFECTANT.—The value of sulphur as a disinfectant should be well known, says Henry Stewart in the Times. By burning it, the sulphur is oxidized and becomes a most acrid and poisonous vapor known as sulphurous acid. This acid quickly destroys all kinds of germs, whether of mold, mildew, and other kinds of minute fungi, or of those organisms which cause disease in plants and animals. The germs of all the contagious diseases of farm animals are destroyed by exposure to the fumes of burning sulphur, and wherever these diseases have appeared, or are expected to appear, they may be avoided by closing the buildings and fumigating them with sulphur wrapped in paper moistened with kerosene oil to make it more inflammable, screwing up the paper and lighting one end. The papers, for safety, should be put in an iron pot or pan. One ounce of the sulphur will be sufficient to fumigate and disinfect a small poultry house, and a pound will serve for a large stable or barn. The building should be tightly closed to retain the fumes, the cattle, of course, being removed meanwhile, and the sulphur should be burned in several places over the floor so that every part of the building may receive a full share of the disinfectant. As the salt known as hyposulphite of soda consists of sulphurous acid united with the base, it is a useful internal disinfectant, and as its action on the internal organs is safe, it is usually given as a preventive to the animals which have been exposed to infection or contagion.

POINTERS.

PETER HENDERSON says that the business of market gardening, though healthful and fairly profitable, is exceedingly laborious, from which any one not accustomed to manual labor would quickly shirk. The labor is not what might be called heavy, but the hours are long—not less than an average of 10 hours a day for both summer and winter. No one should engage in it after passing middle life, neither is it fitted for men of feeble constitution, for it is emphatically a business in which one has to rough it, and if it is to be prosecuted successfully the owner must put his shoulder to the wheel at least as strongly as his roughest employee.....

A LONGER trial of the Red-caps does not change the opinion previously expressed that they are less profitable than better known breeds. Their eggs average one more to the pound than those of Wyandottes and they are lighter in color—nearly white. But they are small in body and the big comb is a decided objection.....

THE PATAGONIANS are an interesting lot. The race is so little fixed as not to be entitled to a name at all. They seem to be a mixture of Houdans and Games, and possibly other breeds. They are hardy, plump, medium-sized fowls, contented and quiet. Their eggs average as large as those of Wyandottes, varying in color. The small topknot is no objection; the small comb is in their favor. Among our pullets is a pure white Patagonian. Others are black and variously mixed.....

THE R. N.-Y. was probably the first of the stations or journals to try the Wyandottes both dark-colored and white. As to the first, we have merely to repeat the opinion expressed in these columns several years ago, viz., that they should be ranked as among the very first all-purpose breeds. There is but one objection to them—a rather inferior-sized egg. The White Wyandottes come true to color. They are plump, early-maturing, full-feathered fowls, quiet, and desirable in all ways.....

OUR Andalusians were condemned on account of small bodies and large Leghorn-like combs. Crosses of Andalusians and Wyandottes, however, have given us some of the most perfect individuals we have ever seen in so far as shape, markings and feathers are concerned.....

PETER HENDERSON says that peat moss, now being used in the cities for bedding, is likely to be of great value to the market gardener if it can only be had in sufficient quantities. He has had it in use in his own stables for about two years, and finds it not only more economical than straw for bedding, but its absorbing qualities make it of great value for fertilizing purposes. He can buy ordinary straw manure in his vicinity for $1 per team load; but he is buying all he can get from stables where the moss is used at $2 per team load, believing it to have twice the value of ordinary straw manure. It is claimed that the source of supply of the peat moss in Europe is almost inexhaustible, and it is now offered by three or four firms in New York at prices ranging from $12 to $14 per ton, and it is hoped competition will bring it yet still lower. It is now used exclusively as bedding by some of our largest horse-car stables and express companies in New York and vicinity; and one of our largest livery stable men in Jersey City, who has been using it for two years, says he would rather use peat moss for bedding at $14 per ton than he would straw for nothing, so much more satisfactory does he find it in all respects for his horses. There are, no doubt, many swamps in the United States composed of peat moss, which may some day prove gold mines to the discoverers, as these deposits in Germany must now be proving to their owners.....

MR. M. MURRAY, of Centre, Ohio, claims that the new seedling potato, "Ross," is better in quality than the Rural New Yorker No. 2.....

DIRECT.

——LIFE: "If we can love our neighbor the world is bound to be interesting to us. Don't doubt, don't forget it. If you love no one, you are a wretched failure, a poor old machine, the parts of which are wearing out without anything to show for their activity. If you love your friends there is hope for you; you must be getting some comfort out of life. If you love your neighbor, that is the fulfillment of the law. Great is duty, and it pays to do it, for that makes life sweet. But if you love your enemies, that, brethren, is the fulfillment of the Gospel. If you can do that the true Christmas spirit must be in you. Let it out, comrade, let it out; it is rare in the world. Not every one knows that it exists, but you, who have felt it, know that it is the golden key to life."

——THE ART OF MAKING GIFTS. "In selecting an arm chair for papa seek one that will match his temper rather than his complexion.

Girls over 20 are likely to feel insulted if presented with wax dolls.

If your husband smokes, insist that he shall use the box of cigars you gave him at Christmas. This may cure him of the habit.

If you have a neighbor whose love of music keeps you awake o' nights it will be a polite tribute to his taste if you send his small boy a drum.

Your mother-in-law will be intensely gratified if you give her—her own way.

A few sheets of postage stamps may be gracefully offered to struggling genius.

Your sweetheart will probably be as much pleased with an engagement ring as anything else you can give her."

——DR. TALMAGE: "I would not take up smoking again for all the surplus in the Treasury."

——REV. R. HEBER NEWTON: "I can scarcely fancy myself seeking spiritual consolation from lips whence issue the odious fumes of nicotine."

——REV. THOMAS ARMITAGE: "There is something so unclean, morbid and adverse to the daily life of the Lord Jesus in the practice of smoking, chewing or snuffing tobacco that the very thought of associating the Son of God therewith would be scouted by the slaves of these practices as savoring of blasphemy."

——REV. THO'S. K. BEECHER: "Tobacco has its uses no doubt. He is a rare man who learns to use it usefully."

——POPULAR SCIENCE NEWS: "The treatment of pneumonia by chloroform inhalations is reported upon by Dr. Theodore Clemens, in Alleg. Med. Central Zeitung. During 42 years' practice he has treated all cases of pneumonia, severe or mild, with chloroform inhalations, and has not had a single fatal case. To the chloroform he adds alcohol, saturates some cotton twisted into a ball, covers it with some loose, dry cotton, and holds this to within an inch of the patient's mouth and nose. He thinks that the chloroform spirits are taken by the blood, completely changing it in the lungs, and, by defibrinating, preventing its hepatization."

——TENNESSEE EXPERIMENT STATION: "Considered as a food the strawberry would hardly be rated as very nutritious. The small amounts of food constitutents present are so diluted by the ninety per cent. of water, that to sustain life a very large quantity would have to be consumed."

——LONDON LIVE-STOCK JOURNAL: "We regard, in fact, the American people as being distinctly an assistant and ally in the battle of life—and not an enemy. When we read of what it has done and is doing, and see what it has let us have and is likely to forward, we think this island has been, and is likely again to be, altogether a gainer by any prosperity which may befall the Greater Britain beyond the sea."

Miscellaneous Advertising.

Rheumatism

We doubt if there is, or can be, a specific remedy for rheumatism; but thousands who have suffered its pains have been greatly benefited by Hood's Sarsaparilla. If you have failed to find relief, try this great remedy. It corrects the acidity of the blood which is the cause of the disease, and builds up the whole system.

"I was afflicted with rheumatism twenty years. Previous to 1883 I found no relief, but grew worse, until I was almost helpless. Hood's Sarsaparilla did me more good than all the other medicine I ever had." H. T. BALCOM, Shirley Village, Mass.

Hood's Sarsaparilla

Sold by all druggists. $1; six for $5. Made only by C. I. HOOD & CO., Lowell, Mass.

100 Doses One Dollar

NOTHING ON EARTH WILL MAKE HENS LAY LIKE SHERIDAN'S CONDITION POWDER

Highly concentrated. Dose small. In quantity costs less than one-tenth cent a day per hen. Prevents and cures all diseases. If you can't get it, we send by mail post-paid, One pack. 25c. Five $1. 2 1-4 lb. can $1.20; 5 cans $5. Express paid. Testimonials free. Send stamps or cash. Farmers' Poultry Guide (price 25c.) free with $1.00 orders or more. L. S. JOHNSON & CO., Boston, Mass.

9 Cords IN 10 HOURS

Runs Easy. NO BACKACHE. Folded

BY ONE MAN. Write for descriptive catalogue containing testimonials from hundreds of people who have sawed from 4 to 9 cords daily. 25,000 now successfully used. Agency can be had where there is a vacancy. A NEW INVENTION for filing saws sent free with each machine, by the use of this tool everybody can file their own saws now and do it better than the greatest expert can without it. Adapted to all cross-cut saws. Every one who owns a saw should have one. Ask your dealers or write FOLDING SAWING MACHINE CO., 305 to 311 South Canal Street, Chicago, Ill.

GRIND YOUR OWN Bone, Meal, Oyster Shells, Graham Flour & Corn, in the $5 HAND MILL (F. Wilson's Patent). 100 per cent. more made in keeping Poultry. Also POWER MILLS and FARM FEED MILLS. Circulars and testimonials sent on application. WILSON BROS. Easton, Pa.

Horticulturists'

RULE-BOOK,

Being a Compendium of Useful Information for FRUIT-GROWERS, TRUCK-GARDENERS, FLORISTS AND FARMERS, by L. H. BAILEY, Horticulturist of the Cornell Experiment Station, Professor of Horticulture in Cornell University, and Corresponding Editor of The American Garden.

Contains in handy and concise form all the RULES and RECIPES required by fruit-growers, truck-gardeners, florists, etc. Bound in flexible cloth covers, and designed as a pocket companion. Lists of all INSECTICIDES and HOW TO USE THEM. INJURIOUS INSECTS and REMEDIES. PLANT DISEASES and REMEDIES. Chemical Analyses of plants, fruits, fertilizers, seeds, etc. LIFE OF SEEDS. Dates for Planting. Recipes for GRAFTING WAXES and TREE WASHES, Perfumes. WAYS OF GRAFTING and BUDDING. Weeds. PROPAGATION OF PLANTS of all kinds. Methods of KEEPING and STORING Fruits and Vegetables. Standard WEIGHTS and MEASURES. Effect of Wind on Cooling Glass. Quantities of Water in Pipes and Tanks. Labels. RULES FOR NAMING Varieties, etc., etc., etc. Names and Histories of Varieties. THOUSANDS of Useful RULES, RECIPES and METHODS for Practical Cultivators. Statistics of Horticulture and the Vegetable Kingdom, and all the specific information which the busy cultivator likes to have in his mind and at his tongue's end. PRICE in flexible covers, $1.

GIVEN AWAY We give away a copy of the **Horticulturist's Rule-Book**, or of the **Annals of Horticulture** for 1889 (another useful book we publish, price $1), to any subscriber of **The American Garden** who sends us ONE NEW yearly subscription for 1890; or **both books** for ONE NEW YEARLY subscription and ONE NEW SIX MONTHS' subscription OR, we will send the **Two Books** (price $2) and a year's subscription to **The American Garden** (price $2) all to one address for **$3.**

IF you have not sent for a specimen number of **The American Garden**, you should do so immediately. It is the largest handsomest and most valuable gardening magazine in the world. DON'T send for it unless you are interested in Fruits, Vegetables, Flowers, or some branch of Horticulture.

Subscription Price, $2 a year; in club with **Rural New-Yorker**, $3.

THE
RURAL NEW-YORKER,
(34 PARK ROW, NEW YORK),

A National Journal for Country and Suburban Homes.

Conducted by
ELBERT S. CARMAN.

SATURDAY, DECEMBER 28, 1889.

NOTICE.

THE RURAL NEW-YORKER is invariably discontinued at the end of the term subscribed for. Any copies sent to non-subscribers are sent without charge as specimens merely.

The R. N.-Y. will begin 1890 with a Dairy Number which we hope will help our winter dairymen. A strong feature of this number will be an exhaustive report of the recent meeting of the New York State Dairymen's Association at Ithaca.

ATTENTION is called to the special premium offered on page 850. The papers are full of offers to send books for almost nothing. Most of such books turn out to be poorly printed on inferior paper, and cheaply bound. The R. N.-Y. offers a book well-bound, well-printed and well-written. We know our readers will find it valuable. For three subscriptions it is an excellent premium.

ONE man writes the R. N.-Y. that farmers read too much about crops and stock and too little about political economy. Another man, living in the same town, thinks farmers spend too much time over the daily and political papers while too little is given to reliable agricultural literature. Who is right? The R. N.-Y. sees good men wasting time over worse than misleading political discussions, while others give valuable time to worse than senseless agricultural information.

IT is respectfully submitted that the R. N.-Y.'s index is more systematically arranged and more comprehensive than any published by its esteemed contemporaries. Making it up is the most trying, perplexing and tedious work of the year.

"Now why should a half-starved orchard bear a full crop every year any more than a half-fed cow should give a maximum yield of milk or make the greatest possible amount of butter? Will young stock grow without feed, or horses do their best work when half-starved?"—See page 850.

THE Early Vermont is the potato named as having yielded over 1,000 bushels to the acre, taking the first prize. The variety has never had the reputation of being a heavy yielder. Its yield was low in the R. N.-Y.'s trials with it. Possibly Mrs. Day planted some other variety under that name.

THIS is the way a Michigan subscriber puts it:

"DEAR RURAL: (I had almost written Dear Friend, for I have taken the RURAL so long that it seems like a friend.) This month completes the eighth year you have visited us weekly, and beneficial acquaintanceship for that period is almost long enough to make a dear friend."

THE R. N.-Y. is in some distress over the fact that, having in its experiment grounds a gooseberry that in several respects is superior to any other variety known to it, it has as yet no authority to give it to others or to have it introduced. It was sent to us as No. 2 by the late James Dougal of Windsor, Ontario, Canada, in the fall of 1883. All of our several endeavors to communicate with his heirs have proven unavailing.

YOU eat too much, good friend. All of us do. Don't ever fear that you will eat too little. The most idiotic way of celebrating a holiday is by eating too much. You do not sleep enough. There is little fear that you will sleep too much. Sleep never injured any one. It is Nature's restorer. It is one of the sweet rewards of industry and of a serene conscience. You can not afford to hate your neighbor. Did it ever occur to you that hate costs more than diamonds, and that it isn't worth one cent? Tell me of a single instance where hate serves you well. Keep these R. N.-Y. injunctions in your mind for the New Year.

AT the recent dairymen's meeting at Ithaca, the following was adopted:

"Resolved: That this convention recommend that every dairyman in this State purchase scales or balances and that all weigh and record the milk of each cow separately for one year and report the same to the secretary of this association."

The convention asked Congress to enact a law requiring all skim-milk cheese to be branded as such at the factory where it is made. It is an encouraging sign that cheese-makers all over the country are making desperate efforts to make clear the distinction between the best cheese and that of an inferior grade.

HERE is a New Year's thought for you. The American people drink, each year, over $900,000,000 worth of liquors. The manufacturing, handling and selling of this stuff provides work for a number of workmen, but that is all the good it does do. Take this amount of money out of the total amount in the country and a big hole is left. It is a hole large enough to account for a large proportion of our "hard times." The misappropriation of this money will account for low prices, business stagnation, want, dissatisfaction and crime, as no other factor can account. Put a stop to the liquor traffic and do you suppose there would be so much blame cast upon trusts and monopolies? This is a fair question.

ONE of the soundest men in New York State sends us the following.

"On page 820 S. B. Harlow Jr., has given us an exceedingly valuable estimate of the worth and influence of the farmers' institutes, and from attendance at several institutes, I agree with him in his criticism of the various speakers; but I have too high an appreciation of the influence of my mother and my wife on my own life to wish with him that the ladies might be excluded. Undoubtedly the primary object of these meetings has to do, as he says, with *practical* farm management; but the discussion of all things that will enhance and elevate the farmer's home life has an equally important place. I take it that we should not hold ourselves down too closely to a mere rule and-measure discussion of details of management, but after these are disposed of, give consideration to some of those questions that elevate and broaden and give us a larger and better view of men and things."

"THE mild weather of the past three winters has had more to do with the stagnation in the woolen goods business than anything else." This statement was recently made by a man who has been long familiar with the woolen trade. Is it sensible or not? Ask yourself whether in a mild, open winter the members of your family require as large a supply of woolen goods as is purchased in an extra cold winter. There are thousands of people who put off the purchasing of thick under-clothing until the coldest weather sets in and if this cold weather does not come before late in January many of them try to get through the winter with cheaper and lighter goods. The result is that sales of the heavier goods are seriously cut down. When the sale of an article is cut down, manufacturing must stop or over-production ensue. Heavy woolen goods go with cold weather. Until we have the cold weather, a portion of the goods will remain unsold, and production must be cut down.

THE R. N.-Y. has no special prospectus to present for 1890. We have always said that those who desire to know what the future R. N.-Y. will be must judge by the past. The paper will never go backward while the present editors have anything to do with it. That is the only promise we care to make.

Readers will be sure to hear from all of our old correspondents during 1890, and we expect to introduce many new ones. We shall, as always, endeavor to be independent, accurate, honest and conservative. We shall endeavor to keep fully up with the times in all departments of farm life. Particular attention will be given to sheep husbandry and dairying. Horticulture and gardening both as a business and a pleasure will be treated by the best authorities in the land. We cannot begin to tell, in a single page, the interesting questions we have on hand for investigation. They are certainly interesting to us, and we believe they will be to our present readers. It is, of course, superfluous for us to say that we shall be glad to have all our present readers enjoy the discussions with us.

ONE of the most effective hinderances to the extermination of contagious pleuro-pneumonia among cattle in this country is the conflict of authority between the State and National authorities—between the various Cattle Commissions and the Bureau of Animal Industry. Such conflicts are based, of course, in a great measure, on the old doctrine of States' rights against Federal encroachment, but they are just as common in the North in which centralization is supposed to have great weight, as in the South where State rights are still a cherished inheritance—just as common in Illinois and New Jersey as in Maryland and Virginia. Pennsylvania is the last State in which such a conflict has occurred. A short time ago the State authorities ordered three affected cows in Chester County to be killed, but as the disease was directly traceable to Baltimore, they did not think it necessary to quarantine exposed animals. A few days later the agents of the Bureau of Animal Industry visited the section and promptly quarantined twelve herds. The national authorities can quarantine cattle in transit from one State to another, but there their power ends. Governor Beaver, of Pennsylvania, promptly notified them that such an action must not be repeated, and the owners of the herds have been paying no attention whatever to the Bureau's proclamation. Should not some means be devised by which such unseemly bickerings and quarrels may be avoided?

WHAT PAID BEST?

THE crop reports in this paper are interesting and unique. They are truthful and suggestive. The crop and product, it seems, must be adapted to the local conditions of soil, market, seasons, etc. So far as grain crops go, corn seems to have given best satisfaction. Our correspondents state very clearly the fact that corn gives its greatest returns when made into beef, pork, wool or butter. The silo and the new methods of preserving corn-fodder have done much to insure the value of the corn crop. The apple crop has proved exceedingly profitable to many farmers, and a great deal of this profit was due to the use of Paris-green and to careful culture and manuring. The hog and the dairy cow seem to have been the best paying animals, though sheep have carried many of our friends along. It is gratifying to learn that all who have made a systematic effort to improve their animals by the introduction of improved stock, have found such a change profitable. The maple-sugar makers are all happy. This is a product that can be profitably increased. The potato crop has, on the whole, been a disappointment this year. In the sections where the best markets are found, the crop has been poor; in the sections far removed from markets the crop has been large. Those who might have realized good prices have not had the potatoes to sell, while those who had plenty of potatoes to sell have been obliged to accept a low price. Dairying has been the sheet-anchor of hundreds of our readers.

The Michigan man, who says on page 850. "There is no more profitable stock farming than all-the-year-round dairying," hits the secret of his success when he says that he can see that his fields are getting more fertile. Next to honey or maple sugar, butter takes less fertility out of the farm than any other product, while its production necessitates the manufacture and application of stores of the most desirable fertility. No wonder the butter dairyman sees his fields growing richer and his crops growing larger. The hay farmers seem to have done well this year. In fact, every section of the country seems to have some product that has given satisfactory returns when well handled. It is the R. N.-Y.'s wish that the year now closing may long be known as the worst season for American farmers. If we could only have our way each succeeding year would bring an added store of prosperity and happiness to the farmers of the country.

BREVITIES.

THE horses like a few raw potatoes just now.

THIS week the R. N.-Y. was offered a coop of good Brown Leghorn hens at 10 cents per pound.

ISN'T the best farmer the one who secures a liberal support from tilling the fewest number of acres?

DO NOT throw hen-manure and wood-ashes into the manure pile. They are worth more to apply to special crops.

WE estimate that something over 3,000 questions have been answered under the "Farmers' Club" in this volume of the R. N.-Y.

WE find that a good many farmers in Western New York are sowing plaster on their clover now instead of waiting till next summer.

"A CROSS-GRAINED man that loses his temper at the first provocation can scare more fat off a sheep in a day than he can replace in a week." See page 858.

DO YOU keep your chicken manure dry or wet? The number of farmers who believe in keeping it *wet* increases every year. What do you think about it?

THE R. N.-Y. notices, with a good deal of pleasure, that the farmers' institutes in this State are being followed by the formation of excellent farmers' clubs.

GOOD LUCK, good health, a clean conscience and work that keeps you busy! We wish you this whether you stay in the R. N.-Y. family another year or not.

MR. TERRY is going to tell us about the cash sales from his 50-acre farm. It is also expected that he will tell us what he would raise if he lived too far away from a good potato market.

LET US BE FRIENDS.—If we are to part company with this issue, let's be friends over it anyway. If we keep together a year longer we will hope to be better friends than ever.

AWHILE ago the R. N.-Y. bought a barrel of Tompkins King Apples for $3.75. The apples on the top were fine specimens, those below being a mixture of Baldwin, Ben Davis, etc., of poor quality. Well what about it? Simply that we shall not trouble that particular dealer again.

THE potato sorter is becoming a very useful implement on potato farms. There are several different makes all working on the same principle. The potatoes are put on a large wire sieve through the holes of which the small potatoes fall while the larger ones roll down to bags which stand ready for them.

NECTAR is a black grape which originated with the late A. J. Caywood. A vine was sent to the R. N.-Y. in May of 1888, and bore its first fruit the past season. The berries were ripe September 1, a few days before Concord. They are round in shape, of medium size with firm skin, about like that of Ulster, and pure in flavor.

YES, the R. N.-Y. fully concurs with the views of the agricultural students of the Wisconsin University, viz., that "how to hold the plow, milk a cow or sow grain," should be learned at home on the farm. Agricultural schools are not needed to teach such elementary work any more than literary colleges are needed to teach spelling, grammar and geography.

A CANADIAN subscriber, in renewing his subscription, gives the R. N.-Y. the following advice:

"Advocate Continental free trade; but don't even wish for political annexation. The greatest good to the greatest number will result from the honest working out of two political systems side by side. We Canadians greatly admire you Americans, but we think that in some things we are freer than you. 'If ignorance is bliss,' all right."

NOTES ON 1889.

(*Continued from Page 852.*)

farms (from 200 to 1,000 acres each) with poor help. Besides, most of our people have not got over the effects of slavery. We want pushing Northern people, and until we get them among us, I see no chance for improvement. We have every natural advantage, such as a good, kind soil, good roads, good water and good railroad facilities; what we want is men.

Perryman. S. H. E.

ILLINOIS ILLUSTRATIONS.

CORN has paid me better than any other crop I have raised this year or any year that I have farmed: but, of course, at the present market price it will not pay the expenses of raising, cultivating and gathering it, together with six per cent. on the investment, or more than do this. But by putting it into hogs that have been raised on the farm and escaped the swine fever, and getting $3 to $3.50 per cwt. for them, the raising of corn becomes profitable, and one is paid something for his time. This is the pretty side of the matter. One can't raise profitably more than two or three crops of corn and have it pay six per cent. —then come seeding down, meadowing and pasturing that don't pay six per cent.; but we have to give our land a change or rest from corn or any one kind of grain.

Walnut. L. K. T.

MY best paying crops are wheat and hay —clover and Timothy. I raise these crops because they are better adapted to the soil than any others. My farm was a worn-out piece of land and I raise mostly clover followed by wheat, then clover again for the improvement of the soil. Wheat I have sold at 70 cents per bushel this year and clover hay at $8 and Timothy at $10 per ton. I also raise cattle, buying most of them while young at the farm for $3 to $5 per head. I keep them through one summer and sell them to butchers for from $10 to $14. My object is to improve my land rather than make the most money at farming in one year. P. O. J.

Metropolis.

SINCE the Anglo-Swiss Condensed Milk Company has erected its enormous buildings for the purpose of manufacturing condensed milk, farming has been almost revolutionized in this immediate vicinity. As the prices paid for milk by the company have been very satisfactory to farmers, many have been induced to change from grain and stock to dairy farming. The present contracts call for 1,400 or 1,500 cows, and the present price paid for milk is $1.30 per cwt. As this is a new industry for this vicinity, I am unable to give any correct figures as to the net profit; but, like my neighbors, I know from my income from the business, as compared with that from other industries, that the former pays by far the best. The present high price, however, may not be long maintained, as it may be only a "bait" which the manufacturers of condensed milk have thrown out to induce the farmers of this vicinity to invest heavily in the dairy business, and after things have been got into convenient shape for dairying, the company may knock the price down quite below the cost of production, as is often done by other monopolies of this class. R. W. G.

Woosung.

THE crop that has paid me best this season and in fact for several seasons past has been hay. The crop is very large this year; still good prime tame hay is worth $5 per ton in the city. Potatoes have also given a good yield, but the prices are low—25 cents per bushel. One reason why hay has paid well is that it does not cost as much to raise as many other crops and there is a steady and increasing demand for it, and I think that it will continue, still in view of the varying conditions of soil, climate and location as well as of the supply and demand and also for many other causes, what pays one man best may not pay another at all, even were they in the same immediate neighborhood. Success or failure will depend on the man himself. Were I asked what pays best as a general business among our Western farmers I would say, stock-raising and farming combined, raising all standard crops and feeding all on the farm and selling the stock and using the manure on the land. J. H. W

Sterling.

MISSOURI MEN MAKE MENTION.

GRASS and corn pay me best. Of 240 acres only 30 acres are cultivated to corn. Everything that is grown on the farm, is fed to stock till they are in good condition for market. The cattle go off when about two years old; the pigs when from five to seven months, the wether lambs at weaning time; and the ewes when four years old. I do not sow any wheat. J. T. F.

Bates City.

THE corn crop has paid best this year. I got enough corn at 25 cents per bushel to pay for the land on which it grew, the first cost having been at the rate of $10 per acre. The crop will bring 25 cents in the market and is worth more than that for feeding to stock, especially swine. It will pay to increase the yield, though this was very good the past season—40 to 60 bushels per acre, and it was of good quality.

Corneau. G. W. T.

WISCONSIN WISDOM.

CLOVER has paid best the past season. The first cut for hay amounted to three to four tons per acre, and the second cut for seed gave two to six bushels. Hay brings $5 per ton; seed $3.50 per bushel. I cut the clover two years for hay and seed, and the third year pasture it with hogs or sheep until the last of August, then plow it under for corn for the fourth year; the fifth year I sow clover with wheat. The corn I feed to hogs, so that it is clover, hogs, corn and sheep; it takes five years to get around. My land keeps producing better crops and we live very well. J. M. S.

Princeton.

I AM engaged in dairying exclusively. I aim to feed all my cows well so that I cannot say that I can profitably increase the product. There is a limit to profitable feeding. As to the land, it gets so little feed I cannot raise oats or wheat with profit. I find it a slow process to get ahead at present prices for dairy goods with the high labor we have to use. A. S. B.

Salem.

VIRGINIA VIEWS.

MY principal product and, in fact, the only one of any consequence, is milk, which means large crops of hay, corn, corn-fodder and turnips, for all of which this portion of Virginia seems particularly adapted. I ship milk directly to Washington, distant only 17 miles, receiving 13½ cents net per gallon in winter and 9½ in summer. I have only been in this State a year and a half and so am hardly able to say whether there is much profit in the milk business or not. My principal object is to make a large quantity of manure, with which to enrich the proverbially poor Virginia soil. The land is really poor, but with one application of manure it will produce as large crops of corn and hay as I ever saw in New York State. I think it will pay me to increase the milk business to its largest capacity, as I have 100 acres, all clear land, and I think that in a few years I can make it carry 50 cows. There is a large quantity of poor land in this part of the State, but it is very easily made productive. All that is needed to make this a splendid farming country is a little Northern energy, enterprise and capital. W. R. G.

Oakton.

OHIO OUTLOOK.

No crop has left much margin of profit with me during the past year, as prices have been so low and I had a wet season to contend with. Corn on wet land was nearly a failure and all other crops were short except grass, which made a large growth, but the weather was so wet while it was being cured that there is more poor and unsalable hay than I ever before saw in this section, a large part of it being almost worthless for anything but manure. There is one thing that has paid well, in fact, a large profit on the labor bestowed on it, and that is a maple orchard. The sirup is a cash article and brings readily 75 cents per gallon in bulk, and on private contract from $1.00 to $1.25 to consumers, and though it is hard work to make it, it lasts only a short time, and comes at a time of year when a farmer cannot do much else. It will certainly pay to increase this to the utmost limit; for the West cannot compete with us, and there is no "trust" to control and dictate prices for a luxury that cannot be made extensively enough to glut the market, and it will therefore always command good prices and pay well for manufacturing. R. B. C.

Garrettsville.

WOOL. This is a great wool-growing section. We are too far from market to handle much that is perishable or that cannot be easily moved. Our land is rolling and too thin to produce crops of grain continuously like some of the more favored sections of this State. It is much better adapted to grazing than to anything else. We raise most of the grain we use, but we do not use as much as in cattle and hog sections. Wool-growing is not as profitable as it was before the reduction of the tariff: but it is still more profitable than anything we can engage in at present. We can only farm such fields as need resetting, being generally about 10 acres out of every 100 of cleared land. The rest is kept in grass, and will, in addition to the necessaries, such as a cow for family use, team, etc., keep 100 sheep. The wool from these sheep at present prices should be worth $200, and there should also be a small increase in the flock. We can keep at least 12 sheep for every steer. (Some place the proportion as high as 25 sheep to one steer), and at present prices (2½ cents per pound), it is easy to see which would make the best return. Our land is mostly light clay. Along the streams we have some limestone soil, but it is generally very rough C. C. E.

Bartlett.

NORTH DAKOTA'S NOTICE.

MY crop of spring wheat has proved more profitable than any or all of my other products during the past season. There are two reasons for this: First, I thrashed a good crop, (an average of 22 bushels per acre) of the very best quality of bright, clean wheat; second, myself and family did all, or nearly all the labor of plowing, seeding, cutting and stacking: so that the actual outlay for twine, thrashing, etc., did not exceed 10 cents per bushel. I hope it will pay me to increase my crop of wheat next year: and with 90 per cent. of the farmers in this country I will continue to depend on the wheat crop next year and for several years from necessity. Cattle are worthless; corn is much more uncertain than wheat, and will not be largely grown for some years. A large number of hogs cannot be profitably raised until corn is more generally produced. The raising of horses is profitable and many of our better-to-do farmers have turned their attention to that industry: but it requires too much capital and the returns are too slow for the average farmer in this new country. In my opinion, sheep and sheep only can—and would if tried—lift the farmers out of the "rut;" pay off his chattel and other mortgages; release him from the grasp of the machinery men, and relieve him largely from the extortion of railroads. But sheep have not been tried, and I do not wish to be too sanguine before I have tested the value of my opinion.

Sheep Husbandry.

FARMING 900 ACRES AT A PROFIT IN WESTERN NEW YORK.

NO. I.

SHEEP FEEDING.

PROBLEM that confronts every farmer each autumn is how he can best use his hay, corn, straw and corn-stalks. Some solve it by selling all of their surplus hay, straw, etc., saving just enough to carry over the horses and a cow or two. Others turn what stock they have into the barn-yard and let them shift for themselves; while others keep cows and do a profitable business in winter dairying. A few feed steers, and a great many shiftless farmers let their stalks rot down in the field rather than take the trouble to make them do service as a valuable food, and also as a choice fertilizing agent. We feed for two reasons: first for profit, and second for manure.

Success in sheep-feeding depends upon several conditions. It is no use for any one to try to feed sheep if he does not like them. The man who kicks his dog or abuses his wife and swears at everybody and everything cannot hope to be a good shepherd. A cross-grained man that loses his temper at the first provocation can scare more fat off of a sheep in a day than he can replace in a week. Then the first requisite is a quiet, low-voiced careful shepherd. The sheds should be so arranged that they can be made very warm when the mercury ranges in the neighborhood of zero, still leaving plenty of ventilation. One great mistake that many farmers make is that of keeping the sheds too warm in moderate weather. The flocks ought to be given free access to water and salt at all times. I buy my sheep in Buffalo, beginning with a car-load or two in August, and I generally have our full number in the yard by December 15. I should advise buying early in the autumn if possible, as the flock will gain 15 or 20 pounds apiece in two or three months on good pasture. It is not always an immense gain which makes feeding profitable, as some will feed so high that the profits will be spent twice over in the amount of fodder used. A gain of 20 pounds can be put on from grass twice as cheaply as it can be made by feeding grain and hay.

In my boyhood days, father used to drive over two or three counties in search of stockers and be away from home days at a time, and then might not make satisfactory purchases. It was and is hard to buy from farmers on their farms, as usually they place fancy prices on the stock, owing to ignorance of the market or the fond belief that their sheep are better than those of any one else. Now all is changed and for the better. If we want a load, father takes the morning train for East Buffalo, goes at once to the stock-yards where he finds 5,000 or 6,000 head to select from, makes his purchases, gives an order to the shipping agent and comes home, the sheep following on the first freight train.

Buffalo is the best point in the United States to buy sheep for Eastern feeding. There are thousands on sale every morning, including all breeds, ages and varieties, from the choicest Canada lambs to the wild, long-legged Colorados that jump six-rail fences just for exercise. Most of the sheep shipped into Buffalo have been on the road two or three days or sometimes more and naturally shrink about 10 pounds so that if one buys soon after their arrival, he gets shrunken weights, a saving at five cents per pound of 50 cents per head over what he would have to pay if he bought them from the field. This does not amount to much on one sheep: but on 100 it is $50, a sum not to be sneezed at. The freight is only a small item, $10 per car-load and each car will hold from 200 to 250 head. I consider sheep well bought, half sold. After we get them home, they are divided into flocks of about 100 each, and when they are put in the yards, the weaklings and small ones are all put into pens by themselves. My experience has been that sheep, like hens, pay best when kept in small flocks. The sheds are so arranged that there is plenty of ventilation in them and attached to each is a well littered yard where the flock can go out to exercise and drink on pleasant days. There are racks inside the sheds giving ample room to feed hay so that the entire flock can eat at once. We give each flock of 100 a grain ration of a bushel of corn per day in two feeds, gradually increasing the quantity till, during the last month, they have all the corn they can eat and are fed three times per day. The hay is fed nights and mornings so plentifully that each sheep is sure to have enough. Sometimes we use a mixed ration of bran and corn. Refuse beans as sheep feed have never given satisfactory results with us. We sell to local buyers if we can in the month of March; if not, we ship direct to New York, usually to one well known commission firm at the Union Stock-yards at the foot of West 60th Street.

Sheep feeding is a lottery. There is only one profit one can be sure of and that is the manure. Father has fed more or less sheep ever since he began farming, but during the last nine years we have fed from 600 to 1,000 head every winter, not always with profit, but four years out of five there has been some money in it. The men that succeed in any branch of business are those who stick to it year after year and who are

Miscellaneous Advertising.

When Baby was sick, we gave her Castoria,
When she was a Child, she cried for Castoria.
When she became Miss, she clung to Castoria
When she had Children, she gave them Castoria

not discouraged by one or two unfavorable seasons. The outlook for money in sheep this year is rather misty. They are worth a cent a pound more in Buffalo now than they have been for the last two or three years at this time, and the prospects for higher prices next spring are not in the least encouraging. The present high price is not owing to the "Harrison Administration Protection Idea" so much as to the fact that Western sheep-breeders have decided to turn their immense corn crop to better use than formerly by feeding it out to sheep on the farm.

To illustrate this, the Chicago Drovers' Journal mentions, in a late edition, that "about 30,000 sheep are being fed within a radius of five or six miles from Gibbon, Nebraska, and 5,000 around Raymond. This is unusual for those localities but a similar item could be written about hundreds of Western towns that formerly were in the habit of shipping stockers east in the fall. Most of these Western-fed sheep will have to be sold early in the spring, so that their owners can get some ready money, and the indications are that the spring market will be a good one for buyers only. In face of this discouraging future we are going to try to feed our usual number, and father is in Buffalo to day to buy those we vet need. We will feed them in the best manner, make them weigh as heavily as possible by the middle of March and then, like Micawber, wait for something to "turn up" which we hope will be a lively demand with good prices. Our success in sheep feeding may be summed up by saying that we get, on the average, good, fair prices for all that is fed out and have the manure left on the farm. Is not this better than impoverishing the soil by selling off all that grows on it?

EDWARD F. DIBBLE.

Woman's Work.

CONDUCTED BY EMILY LOUISE TAPLIN.

CHAT BY THE WAY.

NEW YEAR'S DAY brings New Year's resolutions—we decide on the faults we shall discard, and the virtues we may adopt. How many of them will survive January? Alas, we are usually as apt at breaking our resolutions as at making them. But we don't believe that any of us are a bit the worse for making new resolves, though such determinations should come oftener than once a year.

* * *

As a holiday, New Year's Day seems less observed now than in former years—the old custom; the custom of holding open-house for the reception of all one's friends is gradually dying out, especially in cities. It seems a nice idea to begin the year by welcoming all one's friends; but there is no doubt that the custom was greatly abused, and this largely accounts for its decadence.

In France the 1st of January is the great day of gifts rather than Christmas; it is kept as a high festival, calling for all sorts of gaieties. All the newest and prettiest ideas of the shop-keepers are for this day, and the children hold high carnival. In England the children's special day during this holiday season is Twelfth Day—January 6th; very elaborate Twelfth cakes are made for it, and it is the great day for children's parties, and pantomimes at the theaters.

* * *

A NOVEL and attractive way to cover perfume bottles is described in the Art Interchange; instead of the silk or satin we are so familiar with the covering used is chamois skin, now very popular in fancy work. Any glass-stoppered toilet bottle may be used, but the prettiest is a rather flat bottle with a long neck. Measure the circumference of the bottle, and cut three pieces of skin one-third of its size, less three-fourths of an inch. The hight must be from about one inch under the bottle to half way up the neck, and the piece of chamois is narrowed to fit. The edges of the three pieces may be pinked or cut in points, and these touched with gold. Perforate holes along the edge, and lace with small cords from bottom to top; this will bring into shape with the bottle. Run a strong thread through the lower edge and draw under the bottom of the bottle. A little design may be painted on each piece. A toilet cushion to match may be covered with satin, with a painted square of chamois laid on the top.

AMONG inexpensive gifts described by the same authority are bureau sachets, made just the size to fit in the bottom of a bureau drawer. An inexpensive one is made with a good quality of cheese-cloth, inclosing one thickness of cotton, and tacked together with colored crewel. Before closing, violet and heliotrope powder is sifted in. A handsomer one is made with Florence silk, tufted with baby ribbons. Small sachets made the same way answer for putting among one's clothes.

* * *

A PRETTY lamp-shade is made of white lace flouncing about 12 inches deep. The leaves and flowers are tinted either in natural or conventional colors, and the edges run with five threads of filo floss the color of the tinting. At the upper edge narrow lace is run on, the join hidden by lace beading through which is run No. 11 ribbon, drawing it up to the size of the shade. On the lower edge, a three-inch fringe of twisted wash silk matching the embroidery is tied in.

GOLDEN GRAINS.

EXPERIMENTAL religion is like a secret in arithmetic—infinitely hard until it be found out by a right operation, and then it is so plain we are amazed we did not understand it sooner.....

NATURE is frank, and will allow no man to abuse himself without giving him a hint of it.....

DR. JOHNSON says piety practiced in solitude, like the flower that blooms in the desert, may give its fragrance to the winds of heaven and delight the unbodied spirits that survey the works of God and the actions of men: but it bestows no assistance upon earthly beings, and, however free from taints of impurity, yet wants the sacred splendors of beneficency.....

MADRIAN says that plain, straightforward morality and every-day righteousness are better than all emotion, and dogmatism and all churchism, says the world, and Christianity says much the same; but plain, straightforward righteousness and every-day morality come most surely when a man is keeping close to Christ.....

THE Rev. T. L. Cuyler, says: The very core of health and happy discipleship is the willingness to deny self, and let the Master have His way. This principle runs through all the deepest, richest experience of the blood-bought and consecrated believer.....

MULLER says faith, though weak, is still faith; a glimmering taper, if not a glowing torch; but the taper may give light as truly as the torch, though not so brightly.

News of the Week.

HOME NEWS.

SATURDAY, December 21, 1889.

THE millers of Pennsylvania are organizing a combination for the purpose of making their own paper bags to beat the Paper Bag Trust.....Unfortunate Johnstown, Pa., has just got a new charter from Governor Beaver, and has taken in Grubtown, Conemaugh, Woodvale, Prospect, Millville and Cambria, which together have a population of at least 10,000..... In Congress Representative Dockery, of Missouri, has introduced a bill reciting widespread complaints that farmers do not receive a just return for their labor and capital, and that their homes and farms are generally mortgaged, and requiring the Superintendent of the Census to collect statistics of the owners and tenants and mortgage indebtedness.....Bills are before Congress enacting a national bankrupt law and a national copyright law. The former protecting honest creditors from dishonest debtors and preventing fraudulent assignments is loudly demanded. There is no clamorous uproar in favor of the latter.....Several bills provide for amendments of the Pre-emption and Homestead Laws looking to better conditions for honest settlers, and two at least provide for the forfeiture of unearned railroad grants.....The nomination of Judge Brewer to a place on the bench of the United States Supreme Court to succeed Judge Stanley Matthews has been confirmed by the Senate with 11 negative votes. The Prohibitionists and Anti-monopolists opposed him; but no valid grounds for opposition by these parties appear to exist..... A House bill provides for the promotion of meritorious seamen to the rank of commissioned officers, and another appropriates many millions for the construction of new war vessels. Our present war-ships are manned, in great part, by foreigners; and there's just as much need of providing American sailors for our war ships as of providing the ships themselves ..... The Republicans have introduced a bill of 30 pages for amending the tariff. Tariff amendment is a necessity for all parties. .....The State debt of South Carolina amounts to about $6,000,000, and it is proposed to pay it off by selling the State's rights to the vast phosphate beds which supply the world with fertilizing phosphoric acid, for $7,000,000, to an English syndicate. The State now gets about $230,000 per annum from the sale of the product in the form of a royalty of $1 per ton. The projected measure is bitterly opposed by the interests already engaged in phosphate mining and by the fertilizer manufacturers; for if the beds are sold, the royalty and therefore the cost of the product are likely to go up..... In view of the certainty that the Sugar Trust will be declared illegal by the Court of Appeals of New York State, it is said that the monopoly has made all arrangements for transferring its assets to a new organization just started for the purpose in Connecticut. These Trusts have the best legal talent in the country to instruct them how best to evade the laws..... Leprosy is steadily spreading in this country and Europe, and is causing considerable alarm among the medical faculty..... .....An unusual number of "annexation straws" appear to be floating on the Canadian political stream just now, especially on the French-Canadian part of it. Indeed the thorough going Englishmen and their descendants appear to be the only strong opponents of the measure. They want all the advantages of Statehood in the way of free trade, without any of its responsibilities. Still a more generous measure of reciprocity would, no doubt, help the Dominion without injuring the Union..... .....In spite of the decisions against the constitutionality of anti-dressed-beef legislation in other States, a bill against the sale of Western dressed beef is being vigorously pressed in the Virginia legislature. It is hardly likely that the legal objections that have proven fatal to such legislation elsewhere, can be avoided in the Old Dominion.....Early in this month Sec'y Mohler, of the Kansas Agricultural Department, reported quite favorably of that bursted sugar fraud at Mineola and other parts of Kansas, according to advices just received..... The Russian influenza or grippe has not only spread over most of Europe; but it has also crossed the Atlantic and is prevalent in New York and Boston, and there are reports that it has appeared in Kansas City. It's annoying but not dangerous..... ....In the Cronin murder trial, in Chicago, Dan Coughlin, Patrick O'Sullivan and Martin Burke were pronounced guilty of conspiracy to murder by the jury, which fixed the penalty at imprisonment for life; John Kunze was found guilty of manslaughter with three years' imprisonment, and John F. Beggs was found not guilty. The verdict was a compromise. There were 11 "obstinate" jurymen who refused to agree with another "obstinate" named Culver who insisted that all were not guilty. The 11 wanted to hang the accused; but Culver's long-continued obstinacy would have "hung" the jury had the majority not agreed to compromise. The verdict meets with general disfavor; even the three wretches who were condemned to prison instead of the halter are dissatisfied and have appealed. The witnesses' expenses in the trial were about $5,000; the legal expense, $20,000; the stenographers and type-writers assimilated $10,000 and the jury $8,000. The total cost was about $100,000; and doubtless before the case is finally settled this large sum will be more than doubled. Miscarriage of justice often costs more than justice itself..... It is charged that the Live-Stock Inspection Bill introduced into the last Missouri Legislature at Jefferson City, providing that no beef should be sold in the State unless it had been previously inspected "on the hoof," was defeated by the absolute purchase of enough State Senators for $25,000 paid by the Dressed Beef Combine. The fight was chiefly between the butchers and the dressed beef men, and the latter raised just five times more boodle than the former could get together. The names of some of the bribed and the amounts they got for their corrupt votes are given. They "won" the "swag" in pretended poker games.....

CONSUMPTION SURELY CURED.

TO THE EDITOR:

Please inform your readers that I have a positive remedy for above named disease. By its timely use thousands of hopeless cases have been permanently cured. I shall be glad to send two bottles of my remedy FREE to any of your readers who have consumption, if they will send me their Express and P. O. address. Respectfully,

T. A. SLOCUM, M. C.

181 Pearl St., New York.—*Adv.*

AGRICULTURAL NEWS.

SATURDAY, December 21, 1889.

AT the recent meeting of the Connecticut Board of Agriculture, the culture of the Rhode Island Bent, an improved pasture grass was discussed. A table showing the economy of the home-mixing of fertilizers was presented, and called out a heated discussion between the farmers and some fertilizer manufacturers who were present. Dr. Jenkins as an expert, did not consider home-mixing an economy in all cases, but it would pay farmers to experiment on account of the greater likelihood of getting pure materials. The Connecticut Farmers' Convention held in connection with this meeting passed resolutions sympathizing with the Massachusetts farmers in their efforts to secure anti-oleomargarine legislation..... Many of the dealers in this city are opposed to the proposed ordinance to sell fruits and vegetables by weight. They say it would be impracticable, and would cause no end of trouble.....Robert Bonner says

CONSUMPTION

that he will leave Sunol in California until next October.... .....For a long time the accumulations of manure about many of the stables in this city have been a constant menace to the public health. The proper officials being so dilatory in abating this nuisance, the ladies in the vicinity combined during the past winter and have been working ever since to secure action by the proper authorities. As a result, the Board of Health have just issued the following order: "On and after May 15, 1890, it shall not be lawful to remove stable manure from any stable or premises in the built-up portion of the city or to cart the same within the city limits without a permit from the Health Department, unless the manure be pressed and baled and be properly covered while being removed and carted or be inclosed in tightly covered barrels so as to prevent the escape of all offensive dors and liquid matter." The object is to compel stablemen to bale the manure. They protest vigorously against this action.....
An English breeder having lost several valuable animals through anthrax, has made arrangements to have his entire herd inoculated according to Pasteur's system.....
The farmers have control of the South Carolina legislature, and have just passed a bill establishing the Clemson Agricultural College, appropriating $39,000 a year in perpetuity therefor. The bill also authorizes the sale of all the farms and buildings of the State Agricultural Department, takes possession of the tax on fertilizers, and the State's share of the Hatch fund.....
.....English breeders are on the lookout for new markets for pedigree stock They have a good trade with South America. but are fearful that it will not last forever. The government of Natal has appointed a commission to consider the question of the importation of blooded stock, and the Britishers are making efforts to attract the business in their direction.....
The Missouri State Board of Agriculture will hold 15 farmers' meetings at widely-scattered points. They had calls for more than 40, but were unable to do more with the means at command. The meetings will begin at Macon City, December 30, and close at Linneus, January 24. The board have done the best possible with the penurious allowance at their disposal. Levi Chubbuck, secretary, Columbia.....
The New Jersey State Grange, Patrons of Husbandry, have for years held their meetings in the Assembly Chamber at the State Capitol. Upon their assembling last week, the superintendent of the capitol refused to allow them to use the hall, but tendered them the use of another room. They refused this compromise and held their meeting in Library Hall.....
The New Jersey State Poultry Association was organized at Trenton recently. Franklin Dye was elected secretary.....Charles Richards Dodge, son of J. R. Dodge of the Department of Agriculture, has the *Ordre du Merite Agricole* conferred upon him by the French Government, for services at the Paris Exposition. His collection of American fibers was considered the best in the exposition, and he received gold medals instead of silver in consideration of his efforts.....The Nebraska State Horticultural Society will hold its winter meeting at Lincoln, January 14-16. The programme is a varied one and includes the names of prominent horticulturists, both in and out of the State. There will be an exhibit of fruit. The railroads will give reduced rates. G. J. Carpenter, secretary.....

Crops & Markets.

SATURDAY, December 21, 1889.

WE certainly live in a progressive age. Spring lambs, chickens and the like used to be raised in the spring and green peas, new potatoes, etc, were formerly hailed as a delicacy to be had by the more enterprising farmers in the Northern States on Independence Day. But the enterprise of experimenters and seedsmen, in originating earlier varieties as well as the development of the Southern fruit and vegetable trade, have placed fresh fruits and vegetables within reach of the city dweller at nearly all times of the year. The development of the process of artificial incubation gives us a plentiful supply of spring chickens while winter is yet with us. Formerly the growing of early spring lambs has proven very remunerative to enterprising farmers, the degree of profit depending upon the earliness with which they were marketed, which has been earlier each succeeding year. This year, however, the much abused New Jersey farmer has stolen a march upon his competitors, and has sent his spring lambs to market before Christmas. They are fine ones too, and sell readily for $10 each. Are we approaching the time when we shall have spring all the year round?

SOUTHERN vegetables are arriving principally from Florida. Good lots are not plenty and sell readily at good prices. Cucumbers are worth $2 to $5 per crate, eggplant $4 to $6 per barrel, and string beans $2 to $4 per crate. The city man can have "spring" vegetables with his "spring" lamb for his Christmas dinner—with the permission of his pocket book.

POULTRY have swamped the market. The accumulation of sweaty, sour, almost rotten stock is enormous; much of it has been seized by the Board of Health and more will be. Choice turkeys are scarce and wanted. All other kinds are in full supply and the receipts exceed the sales, so that the outlook is not encouraging.

EGGS have fallen off considerably in price, as the prevalent warm weather is very favorable both to production and forwarding.

THE R. N.-Y.'S GREETING FOR 1890.

Literary.

BOOK REVIEWS.

BLAKELEE'S INDUSTRIAL CYCLOPEDIA is the title of the most useful, practical book we have seen in a long time. It is intended as an aid to the unskilled in making and repairing, as well as keeping in order the thousand and one articles of use and ornament required in every home and on every farm. The language is plain and the directions so simple that they may easily be understood by the most unscientific. Under "The Home Workshop" directions are given for the care and use of tools, preparing and working timber, the construction of houses, roofs, chimneys, fences, gates, cellars, poultry-houses, cisterns, and innumerable minor articles, garden fixtures, the care of carriages and harnesses, all about paints and paint ng, calcimining, varnishing, gluing, soldering, cementing, etc., etc. "The Mechanical Farmer" tells how to construct farm residences of different kinds, barns, stables, sheds, ice-houses, fences, and dozens of lesser conveniences that can be easily made by the farmer at odd times by means of such simple directions as are here given. Then there is a department, "The Handy Housewife," that includes innumerable useful and ornamental articles which thrifty house-keepers are fond of fabricating. A little money and an ingenious woman will accomplish wonders in this direction. The care and repairing of furniture, beds, carpets, and all kinds of clothing, house furnishings, the making of soap, butter and cheese, pickles, canning fruits and vegetables are all treated. These will be especially valuable to young housekeepers. Then there is a department for the boys which tells how to make sleds, boats, kites, traps, and many other articles dear to the boyish heart, and one for the girls, equally interesting and instructive. It is a valuable book because it will save money. It contains over 700 pages, six by 8½ inches in size over 200 illustrations, and is strongly and neatly bound in cloth, with neat and appropriate designs and lettering. Price $3. The Baker & Taylor Co., New York

A MOST difficult book to review fairly is "A Knight of Faith," by Lydia Hoyt Farmer, for the reason that it is both so very good and so very bad. In spite of the array of titles upon the title-page, showing the number of historical and scientific works put forth by this writer, her latest book leaves the reviewer with the irritated feeling that she should have taken several more terms at school before attempting it. So much bad grammar in a single book it is not often given to us to see. The book is claimed to be "a powerful story and a complete refutation of Robert Elsmere." The first few chapters are unpardonably stupid; while the descriptions are crude, and broken by long and involved dissertations, and the attempt at dialect would do no credit to a school-boy. On the other hand, what plot there is, is not bad, the later chapters increase in interest, and the theological part is really good. The arguments are well arranged and seem irrefutable, and being largely quotations, this part of the book is free from the worst faults of the earlier chapters, and will well pay the reader. It seems a great pity that such laudable effort and so much good work should be spoiled through causes so easily remedied. Cloth; 288 pages, five by 7½ inches; $1 00; in paper covers, 25 cents; J. S. Ogilvie, New York.

THE attractive volume entitled "A New England Girlhood" by Lucy Larcom, is the sixth in the Riverside Library for Young People. The simply told tale of the early life of this sweet singer has more of the charm of a story than of an autobiography, which it really is. The writer speaks of herself as one of a large family, and as therefore having enjoyed the "privilege" of a little wholesome neglect. Descended from the French La Combes through Welsh and English Puritan ancestors, she seems to have been a unique combination of healthy New England capability and its dreamy opposite. Her simple narrative of quaint New England life, of her childish struggles to understand the mysteries of life and religion, of her love of hymns and of versifying, and of the friends who helped to mold her life, is as fresh and pleasing as her verse, while the glimpse of life in the Lowell mills is very interesting, and is entirely new to most readers of the present day. The book is full of helpful hints from the lessons life has taught her, and none of the girls for whom it is written but will be fascinated with it and helped to better living by it and by this close acquaintance with the modest woman who "never attempted remarkable things." Cloth; 274 pages, 4½ by seven inches; 75 cents; Houghton, Mifflin & Co., Boston,

STARR'S BEAUTY.
A new, promising variety of potato, to be introduced in 1890. Flesh color, smooth, compact in the hill, earlier than E. R.; and this year the yield was the best of 29 varieties. D. A. STARR, Uncasville, Conn.

PILES. Instant relief. Final cure in 10 days and never returns. No purge, no salve, no suppository. A simple remedy mailed FREE. Address TUTTLE & Co., 78 Nassau Street, New York City

THE GREAT POTATO CONTEST.

Stockbridge Manures Win Over All Other Fertilizers.

738 BUSHELS TAKE THE GRAND PRIZE OF $1,100.

The *American Agriculturist* for January will say: "Convinced that there is no question as to a yield of over 738 bushels on a fraction less than one acre, and this yield being far larger than that of any other contestant, the *American Agriculturist* awards its Grand Prize of Five Hundred Dollars in Gold to to Mr. Charles B. Coy, of Presque Isle, Maine."

"Among the other prizes offered in the official schedule was one that said: 'If the *American Agriculturist* Grand Cash Prize of Five Hundred Dollars in Gold goes to potatoes grown exclusively on the Stockbridge Potato Manure, the Bowker Fertilizer Co., of Boston and New York, will give Six Hundred Dollars in Gold.' This prize it is also our duty and pleasure to award to Mr. Coy. He will thus receive *Eleven Hundred Dollars in Gold* in prizes, besides the receipts from the sale of this crop, making the best paying crop of marketable (not fancy seed) potatoes ever raised in the world."

This large yield of 738 bushels is not made up of two crops grown on one acre; nor was the seed started in a greenhouse and afterwards transplanted; but from start to finish it was grown in the open field, by a man whose record is above suspicion.

The *Agriculturist* will further say: "The first lesson of this competition is that on the great majority of soils, complete, high grade special potato fertilizers (like the Stockbridge) are superior by far for potatoes, to stable manure. . . . The soil (on which this crop was grown) . . . only needed a liberal supply of plant food in the *right form* and in the *proper proportions*, to insure a good crop. *These conditions were complied with by the use of the Stockbridge Potato Manure.* . . . This case affords a fine example of the profitable use of quickly acting fertilizers which under favorable circumstances convert themselves into large yields of good quality that mean money. For quick cash profits fertilizers are preferable for potatoes on almost all soils."

THE OAT CROP CONTEST.

The yields on Fertilizers were as follows:

1st Yield, B. Gedney, White Plains, N. Y. (On Stockbridge Manure) 87 bushels.
2d Yield, R. T. Scott, Yellowstone, Wis. (On————Fertilizer) 83 "
3d Yield, Geo. N. Beals Sunderland, Mass. (On————Fertilizer) 36 "

Here, as in the potato crop, the Stockbridge Manures distanced all competitors. This crop was raised on land that had been in grass since 1880, but planted to corn in 1888.

As it is not our custom to state the names of any of our competitors, or speak of their goods in any of our advertisements or pamphlets, we would refer our friends who would like to know what fertilizers were used in the second and third yields, to the *American Agriculturist* for December, 1889, p. 651: also to the January number as to the Potato Contest, or send for our 1890 Pamphlet which will appear soon.

The Stockbridge Manures were the original special fertilizers, and, like all good things, have been extensively copied, but the copies have not been equal to the originals in *crop producing power*, as this great contest clearly shows.

BOWKER FERTILIZER COMPANY, Boston and New York.

A WET HEN

The man who has invested from three to five dollars in a Rubber Coat, and at his first half hour's experience in a storm finds to his sorrow that it is hardly a better protection than a mosquito netting, not only feels chagrined at being so badly taken in, but also feels if he does not look exactly like

We offer the man who wants service (not style) a garment that will keep him dry in the hardest storm. It is called TOWER'S FISH BRAND "SLICKER," a name familiar to every Cow-boy all over the land. With them the only perfect Wind and Waterproof Coat is "Tower's Fish Brand Slicker." and take no other. If your storekeeper

Ask for the "FISH BRAND" SLICKER does not have the FISH BRAND, send for descriptive catalogue. A. J. TOWER, 20 Simmons St., Boston, Mass.

TICKS Hon. JOHN E. RUSSELL, of Massachusetts, says of THYMO-CRESOL (the Cold-water Dip):—"*It will stimulate the skin, increase the growth of the wool, and destroy all parasites. I would not be without it if it cost $10 a gallon. It is the best thing for sores of any kind.*" Non-poisonous. Safe in coldest weather. Imported only by LAWFORD BROS., Baltimore, Md. Sample by Mail, 50 Cents. Mention this Paper.
